18 inches or so, has the effeot of drawing the plants a little, and making them deoumbent instead of upright, with remarkably good effeot. As few British Ferns are naturally decumbent, the highest wall-pooket of all was originally devoted to a Woodwardia radioans, the fronds of which drooped nearly to the ground, and were quite 7 feet long, until a specially severe winter killed it. At the foot of this wall is a low rookery, except in the centre, where a sunken petroleum-barrel forms a rockfringed pool, into whioh the rain-water from the roof is drained by two underground pipes. This rockwork extends round three sides of the house, and is about 18 inohes high, next a 2 -foot tiled path (porous red-and-white tiles), which runs round a oentral rockery of oblong shape, and built up of fairly bold burrs. The chinks and crevices in the whole of this rockwork are filled with self-sown seedlings of various species, Asplenium Trichomanes especially. Scolopendriums appear in any quantity, and have conslantly to be weeded out, common-or nearly common-onel being too often the intruders. Of specimen plants only two are really planted in this central mound; the King of the Male Ferns, with a fine trunk, and a crown of fronds, measuring 4 feet 11 inches from the soil to the tips; and the Viotoria Lady Fern, a bit of the original, which is no less than 3 feet 6 inohes long, being a single orown, with a distinct trunk. The side-wall to the left is really the garden wall, sarmounted by a wooden one carrying the roof; the opposite wall is red brick, and of the same height, 7 feet, so that there is no side-light whatever. Along the garden wall is ereoted a long slate trough, oomposed of roof-slates, supported at their lower edges on stout nails driven into the wall, and from the upper edges suspended by stout copper-wire attached to hooks driven into the woodwork. This trough, which is well drained, accommodates at the level of the eye, a considerable number of choioe small varieties of Asplenia, Soolopendriums, Crytopteris, and other dwarf Ferns; while from its position it practically does not interfere at all with larger Ferns growing in pots on the rockery beneath. This is really a good idea where space is limited, and indeed where it is not it has a great advantage in affording a habitat for wall and dwarf Ferns at a most convenient level for their examination.

Wherever convenient, flat-backed rustio pots are hang over this trough on hooks and nails in the woodwork, which is painted chocolate, to harmonise with the green. The brick wall on the other aide is largely marked by oork and slate pockets and pots, while a slate shelf just below the roof housen a number of Polypody varieties in pans.
Next the dwelling-house, oonsiderations of damp prevented the use of rookwork, and in one corner a Wardian oase forms a congenial home for several varieties of Trichomanes radicans and Hymenophyllums, while Todea pellucida, T. superba, and T. so grandipinnala sapports the foreign element in conjanotion with T. reniforme. A series of shelves ap to the window level cooupies the rest of the apaoe at this end, and here are a few of the crême de la crême of British Fern wociety, at the head of whioh I must be permitted to place an enormous plant of Athyrium fo-f. plumosum Drueryii, the queen of a section of which I am glad to learn your correspondent poscesser an admired representative. Well may his lady foliss compare these Lady Forns with Male Ferns to the diaparagement of the latter, bat I
fear they muat thank the prophetio instinet of
old botanists rather than Dame Nature for the imputation of the sex, though really the existing varreties show that for diversity of fashion and delioacy of taste no imputation could be more appropriate. In one of the writer's latest finds, indeed, A. f.-f. revolvens, we have actually the "lady" in ringlete.

Although mere size cannot be deemed a special element of beanty, yet since it is usually associated in Ferns with greater development of the oharacteristio features, the following aotual dimensions of some fronds in my fernery may be of interest:-Lastrea f. m. cristata, 3 feet 11 inches, plas a 12 -inoh trank; Athyrium fo-f. Viotoriæ, 3 feet 6 inches; Polystiohum aculeatum pulcherrimum, 3 feet 6 inches; Athyrium f.-f. percristatum (Cousens), 3 feet 3 inches; A. f.-f. plumosum Axminster, 3 feet 7 inches; A. f.-f. plumosum Druergii, 3 feet 6 inohes long by 1 foot 8 inches wide, the pinnæ measuring 10 inches long by fully 5 inohes wide. Chas. T. Druery, F.L.S., F.R H.S.

\section*{New or Noteworthy Plants.}

\section*{NEPHRODIUM (EUNEPHRODIUM) DEJECTUM, Jenn., n. sp.*}

A fine robust apecies, of the size and habit of tetragonam and Leprieari of the Lastrea group, bat of very different general charactera, maiked particularly by the distant tharply-deflected pinver of the lower half of the fronde, atramineoue vaccular parta, and atriation of both aurfaces caused by the close raized veins, the lowest pair of which on one or both sides of the midrib unite together at the ends, forming an elongated loop, an in Pleocnemia. From the patent united lobes at the top of the froade the pinne gradually dellex and widen apart downwards to the base where the distance reaches 4 to 5 incher. G. S. Jenman, Demerara, October 18, 1895.

\section*{Orohid Notes and Gleanings.}

\section*{CatTleya bowringiana.}

We have now in flower and bud four plants of the above, the largeat growing in an 8 inch pot has three opikes, with thirteen, ten, and eight flowers on them ; the other three are growing in 6 -inch pote, the one hav two apikes with nixteen and eight flowers; the other two apikes with nine and four flowers, and the other one spike with fi'teen flowers. I should be glad if you or any of your correapondents will kindly any what is the greatest number of flowers on a spike they know of on this apecies of Cattleya. W. Dawes, Little Vess Gardens, shrewshury.

\section*{Ter Specirs of Dichion.}

Diacrium (Epidendrum) bicornutum, Hooke, and Diacrium (Epidendrum) indivisum, Bradf. MSS., are Ttill common in Trinidad, although the yearly export by collectore has diminished the appply to a considerable extent. D. bicornutam is found almost excluaively on the seashore, where it growe on rocks and the branches of trees well exposed to the breezs.
*ephrodium (Euenphrodium) dejectum, Jenn., n. sp.-8tipites strong, erect, subquadrate, stramineous, slightly puberulou, channelled, If to \(2 \frac{3}{3}\) feet long; fronds erect, pinnate, subcoriscoous, dark green paler beneath, striated, 2 to 3 feet long, 10 to 15 inches wide, the acuminate apex pinnatifid, the base very slightly reduced; rachis strong, and with the midribs stramineous and channelled ; pinnse truncate. sesoile, subproximate, and apreading in the upper half, distant, deflered, and shortly and spreading in the upper half, distant, deflezed, 8 and shortheate at the base in the lower, 6 inches stipitate and subcuneate at the base in the lower, 6 to 8 inches
long, \(1 \frac{1}{3}\) inch wide, tapering to a finally acuminate entire point 1 inch long, cut a third to half-way to the midrib into broadly rounded oblique or anblalcate open loben, \(\frac{3}{3}\) isch wide, with anrrow sinus between, and subcrenulate or even margins; veins conspicuous on both surfaces, close, simple, curved, ten to fitteen to a side all fertile, the lowest three to five oppoate pairs, uniting and running together to the sinus with a streak between, and with the costee. grey, puberulous beneath; sori emall, medial or nearer the rib, reaching from the conta to the apez of the lobes; involucres emall. grey, puberulour, -Guiana: in the region of Malali, Demerarn Hirer, frequent in moist situatione.

It forme at times magnificent clumpl, which ur seen to advantage when in flower, in well-protected positions. A clump of this class was well fogm in the Gardeners' Chronicle, p. 337, vol. xni, 1894. This figare was engraved from a photogriph by F. Morin, Esq, of Port. of-Spaip, from a picture of a plant in the garden of a suburben villa belonging to Mra. Kavanagh. We have had nimilar clumps in flower near the office of the gardene from February to May, where they to simply hang up attached to the blocks of mod in they were cut from seaside trees, having no compon, banket, or other sapport of any kind. The attention they receive is to eecure them against the stecto of insects, cockroaches, \&ce., and to give an occuional watering in dry weather. They are fally expoud vertically, but are aheltered on all oider by bultaizg and treen.
The second apecies, D. indivienm, is one whith it confined almost exclunively to the inland ditrieth It differs from the preceding in being of muth amaller aize, and by having an ondivided lip whech in quite white, and not apotted as in D. bicornatam, and the pseado-bulbs and leaves are alioo much smaller. An expanded flower of D. bicornatm, which was taken at hazard from a clomp, menten \(2 \frac{1}{4}\) inchea in breadth, while another of \(D\). indivinm measures only \(1 \frac{1}{3}\) inches in the ame diameter. \(D\). indivisum is more amenable to caltivation that in larger brother, and maken an exceedingly pruty plant when well grown. Both plants are vay impatient of moistare, and when entablisbed mill atand drought almost with impunity. Donbte bero bsen expressed as to the apecific value of the namo of \(D\). indivisum, but to the field botanist who in converanat with the plants in their homes, the chanctera are clearly marked, and no intermediato form have as yet been aeen. It is true that the latter plant is (as Grisebach aays) nearly allied, bat th difference in form of the lip, ite habit, and the colom of the preado bulbs, as well an its constant habitist in the interior woods, would appear to bear ont 1 legitimate claim to apecific diatinction.
In connection with the growth of Orchids, it he been noticed that the presence of ants is apparestly necesaary to their maintaining a healthy condition bat whether this is in reality due to some action \(\alpha\) the ant itself, or to nome indirect canae, has not fis been proved, and inventigations are needed to tor what is the real influence the ant has apon \({ }^{50}\) health of the plant. It has been suggested thas the presence of atinging anter acts as a protection io the planta, but I am inclined to think from recess innow tigations that the benefits the ante confer of to plant are thone of providing it with the mycelias d a fungus to cover its roots, which organism anab/n it to take up food which would be othernite ur attainable. It may be ahown that the anta at an protectors to the plants, as well as providigg ther with a means of obtaining nutriment, bat it il almost certain that the fangus which grown in wis material they a ccamulate around the roots plasi 1 much more important part by providiag the pladid with food material. Bulletin of Trimidad Duta Garden, October, 1895.
\(\mathrm{Mr}_{\mathrm{i}}\) Godseff's Epidendrdu (Epidgspluya G00.
This is one of the giante amonget the Epidestan the plant itaelf being 2 to 3 feet in heighc, of the more as it grows on rocks and tree tranks in in native wild. The pseudo-balbe are 4 to 6 inchen length, terminated by 2 to 3 strap-shaped, obi'q. pointed, and very leathery leaver. The flower ity a branched at its extremity, and as thick as culma of a alender Bamboo (any, Thamocesam Falconeri) below. The flowers themelves are bur 2 inches in diameter; the prevailing colour bew olive or cinnamon on sepals and petala alite, three-lobed lip being white with parple linef alloned diak. The sepala and petals are incarred, holloms out or apoon-thaped, and marked with faiat lians nerves. The sepals outside are pale fawn colo adm having a faw acattered brown dota. an intef
generally, so this is a very robut and
specier, the flowern being full and of fine form, and their fragrance in the morning is very delicious, reminding one of a mixture of tropical fruits. The plant is very remarkable when growing, on account of its size, and it thrives in a warm moist house when growing with plenty of water at it roots. The plant is now flowering in the Botanical Garden of Trinity College, Dablin. The apecies is named in compliment to Mr. Godseff, who in well known an the manager of the Sanderian collection of Urchids, \&c., at St. Albant. F. W. B. [E. Cappartianum is, we believe, a aynonym of this plant. Eiv.]

Cxphiprdius \(\times\) belligmbut, malformed.
1 As bearing on our remarke at \(p .495\), October 26 , and previously, T. W. Swinbarne, Esq。, Corndean

\section*{TRICHOPILIA BREVIS.}

At the meeting of the Orchid Committee of the Royal Horticultaral Society, Nov. 12, this pretty specier, which was exhibited by Mesars. F. Sander \& Coo, was duly noticed in our columns, and we now give an illustration of the plant (fig. 105). The species appears to be of the section of Trichopilia known in gardens as Heleis, and of which the previously koown species Trichopilia (Heleia) eaguinoleata is well illustrated in the Botanioal Magavine, t. 7281.

Trichopilia brevis is a plant of neat habit of growth. It flowers have the sepals and petals of an Indian-yellow colour, barred with chestnut-brown. The ample labellum pare white, with ef purple marks at the base. It thriven best when grown in a moist intermediate-house, such at mits Miltonis Roezlii, Mittonie vexillaria, and the plante aenally ansociated with them.
average crop, Now England being eapecially deficient ; while in the contral-west the crop in the largent over grown. The aseon has been one of contradictions, new conditions contantly ariaing of anficient im: portance to vitiate preconceived ideas.

May frouta were followed by anch weather as operated to minimise their importance. Drought, growing aerious in June and July, was relieved in Auguat. Oa September 1 the crop appeared virtaally made, and in extent there whe every indication that it was record-breaking. The final output of marketable Applet is large, but it is not the burdensome crop that seemed certain a short timeago.

Dry weather, hot wind and locally severe atorms during Septembar made great changes in the proupect for winter fruit. Tho "windfall" hat been aur-

Fig. 105.-trichopilia brevis flowegs of an indian-yrllow colour, babrrd wita chistnut; Ifp wilte, WITH PURPLB MAREINGS AT TER BASE,

Hall, Winchcombe, Cheltenhaw, writen:-"I am sending jou a flower of Cypripedium nelligerum, taken from a plant which invariably throws ap a similarly deformed bloom as a preliminary, and after that is over, it ands up a apike of good flowera. I have now one with a two-fowered apike following a deformed flower."
The flower is a very singular one. The sepais and petale are of the anal form, but the labellom is inside oat. The part which in the normal flower is at the beck and reating on the lower sepale, being in front, and the opening in the pouch, with the sides turned out instead of in, is at the back. It in a very singular freak, and it bears out our conclasions, formerly expressed, as to the conatancy of abnormal flowers in some plante.

\section*{THE APPLE CROP OF 1895.}

We learn from the American Agriculturist that the estimated commercial crop of Apples of the United States for the present wemon is one of the largest in recent years, and will yield probably \(66,000,000\) buthelt, ahowing an incresse over the sverage prodac. tion of about \(8,600,000\) busbels. When prices are high, at they were lat year, a lot of fruit not umally included in the commercial crop, find ite way into the market. While ordinarily this would never appear, it serves the parpose of ultimately wolling the totalr.
The dintribution of the crop of the preseat year is anid to be peculiar, the greatent Apple-growing districts eant of the Alleghanien showing lean than an
priaingly large, and the ill effect of the hot weather is becoming further apparent in marked difficelty in ascaring frult of perfees keeping quality. Wapecially is this true in couthern Iulsofa, and in portions of Missouri, while in heary-laden orcharde of Miseourl and enstern Kapsas and Nobraka the extent of lowe from high wind can only be appreciated by personal inspection of orchard.

It if difficalt to sccarately extimate the total crop of Apples in barrels, because there has nover been any accurate consus determination of the aise of any given crop. The cenaus of 1890 andertook to give sach a measure, bet the work was very falty from nnintentional omineions. Taking that result, however, as a basis, and as reprementing what might be called the marketable crop an dintinguinhed from the
total crop (including farm consumption, cider atock, and fruit fed to animald, or allowed to rot on the ground), it would seem that the crop this year is about 16 per cent. larger than that of 1889 , and larger than that of last year by about the ame measure.

The crop in the principal States of America in 1889 as reported by the censut, in 1894 as determined by market movement, and in 1895 as eatimated by the American Agriculturist, the only anthority placing auch detailed entimate on record, il preaented in the following atatement:-

An examination of thim table showe that the New Hampshire crop this year is little more than half that of 1894, and nmaller than in 1889. In New York and Pennaglvania it is a third larger than last year, and double that of 1889. The Ohio crop in two and a quarter time larger than last year, while the Michigan crop is less than two-thirds as large as in 1894. The mont remarkable gaint over laat year's production are noted in Indiana, Illinois, and Misnouri-three timen a large in the firat, and nearly double in the latter two. The total crop in these three Staten, however, only slightly exceeds their production in 1889.

\section*{The Canadian Situation.}

Canada, as a whole, has not been favoured with an abundant Apple crop for several yearr, although exceptional localities have borne well. This is true regarding the 1895 crop, with a material shortage in much of Ontario. Owing to the severe frosta about the time fruit-trees were in bloom, many Lake Erie and Haron counties auffered, and Apple-shippert from Toronto wentward, with ponible exceptions of a narrow strip clone to the water's edge and around Niagara, will have lens to do this autuman and winter, the crop being required for home consumption. This important section, which usually has a liberal surplan for shipment, has already marketed a considerable part of their available crop. Down the St. Lawrence river Apples are not grown so largely for export purporen, and will this year provide little. It in certain that the big crop in the United Stater will preclude the movement of any conaiderab'e quantity of Canadian fruit acrons the border, even from favoured sections, and the surplas from Lake Ontario counties and further east will seek an outlet abrond. In the Annapolis ralley, the Apple-growing wection of Nova Scotia, a fairly good crop has been harvented, ipcluding both autumn and winter varietien, the latter being fine in quality, and adapted to the export trade. Early ahipmenta from that province, however, shared no better fate than did thove from the States, as England was well mupplied with home-grown and continental fruit. Conaiderable quantities of Nova Scotian Apples are drifting into Boston, partly on commistion, and providing the market is right, may eventually be reexported to England.

\footnotetext{
The Output fon Ambitcan Subplut on Apples,

}

Staten abworbed much of the surplun of those where the yield was liberal.
But this year the crop in more evenly distributed, and it in an exception rather than the rule to find a State with a positive deficiency.
Tarning to the output on export account, thil may amount to more an the seamon wear away. England is about the only foreign customer that America has. Up to late autumn England is aupplied with fruit from the liberal home yields, and from the continent of Earope, including Holland and Belgiam, which have very large cropa ; France, which turned off fair quantities; Germany and Italy with at leant sufficient crops of Apples of their own to make it improbable they will need to import many, and may possibly wend a few to the United Kingdom, an they do unually. This fruit, however, is autumn atock, and once out of the way should enable American exportern to ship more freely to England. Lateat advices report an increaved interent in leading English and Scotch marketa, with an ontlook for better figures. Showing the draft made apon the various surplas countries for Britiah consumption is the following table of-

\section*{Total 4968,669}

There is just now a aevere sifting of quality, and the range of prices is very wide. Standard varieties of winter fruit, wuch at Baldwin, Greening, Spy, Ben Davis, \&c., are going rapidly into cold atorage, nome of the best posted and largent grower adviaing not to accept present quotations. Thir, too, in apite of the fact that vast quantities of soft etock have either been sold for cider parposes at from 5 to 10 cent per bashel, or elee permitted to rot on the ground. The enormour quantitie of windwalle, cider Apples, poor and gnarly fruit generally, out of the way, the market is expected to clear up. Large as the crop in, it is certainly much leas than seemed assured before the trees began to drop so badly. J. J. Willis, Harpenden.

\section*{Paris}

\section*{MICROSPATHA GUINEENSIS.}

Cultivators know this dwayf Aroid beat under the name of Nephthytim liberics (N. E. Brown, in Gardeners' Chronicle, June 18, 1881, p. 790). We mention it now for the ake of calling attention to the profanion in which the orange-coloured berrien are produced. These are borne in such numbers that the plant is at this seamon very ornamental. The berries are clastered, each about the size and form of a mall Olive, and of a bright yellow or orange colour. At the Jardin den Plantes we recently observed the use made of this plant for ornamental purposer.

\section*{Amphitecha nigripres.*}

This bighly curious Bignoniad or Crescentiad has lately been in flower in the Paria Jardin de Planter. It has an orect atem, oblanceolate glabrous entire leaves, and bears tuft of yellowish-green flower: from the old wood. Each flower in about an inch long, with a thort calyx, dividing into two boatshaped aegmenta, an irregalar tubular corolla, contracted in the middle, dilated on one side below the fous-five parted limb.
" Baillon in Revie Horticole (18\%), p. 484, fig. 89, as Crue centis; see aloo Miers in Trans. Linn. Soc., \(\mathbf{x x Y i o}\) (1888), 183,

Camptosema erythroniomes.*
A handsome tove ahrub, with pinnato folings ovate lanceolate segments, with clusters of row-lilu flower near the apex of the branchen. The individual flowern are something leas than an inch long comprensed, the atandard winga and keel nearly of the same length. The plant which is in bloom is Jardin den Plantes differs somewhat from the phan dencribed and figured by Bentham.

\section*{Idria columparia. \(\dagger\)}

This plant in the Kew Index it referred mith mark of doubt to Fouquiera spinota (Inmy in Emory, Notes of a Military Reconnoissamo 147,, , 8 , Mexico, 1848). The plant in the Jardin da Plamé is highly curious, consisting of a stont, thick, conim stem, 2 to 3 feet high, and as much throughtw base, giving off slender spreading branchen near tha top, and provided with amall-stalked ovato acta leaves. It is a native of Lower Californian Tho figure of Idria cited hat a tall, nearly mbrandob, columnar stem, with atalked apikes of yellow fomen near the nummit. The plant in the Paris guden was not in flower, \(o\) that its identity with Kolloges plant is uncertain. In any way it in highy remarkable, M. T. M.

\section*{HARDY PLANTS AT COLLOONEY.}

Cabyopteris mastacanthus,-This pretty fowerig uhrub (see Gardeners' Chronicle, February 2, 188\%, fig. 149), has flowered at thim place for the firt tim this year. It has proved quite hardy, having withe atood the fromte of last winter under the alight protection afforded by some Spruce brancher; and I hope now that it in well eatablished it will bloom at an earlier part of the autumn. The fiowern come in small clusters from the axils of the lateral ahook and are of a deep lavender colour.

\section*{Clerodendron trichotomom.}

This plant flowered here this autumn, juet previous to the tharp fronts setting in, in October. It in in intereating plant where it thrives, and the flowen come early; and when our plant are well eatebe lished, they may do better in this respect. The young wood is of a noft nature, but it takes no ham, except, perhaps, an odd shoot or two will die buck during a severe winter. It is planted in a border and close to a wall ; and a plant of Abelia rapestin tanding near it flowered profuely this antumn.

\section*{Tupa Fevillili.}

This made a grand ahow in the herbaceons border, with it beatiful pike of red Salvia-like flown, doring the summer and autuma. The plant ancend in good wandy loam, and is benefited by a few applio cations of manure-water at the root when \(m\) ll eatablimhed. Increame is by division of the rooth and from seed.

Hyphricum reptans.
For covering a slope or the rockery, whete a moderate depth of andy loam can be afforidd, this is one of the prettient subjects I know of; and is hardy, very floriferous, and eanily raised from what I have grown the plant in an ordinary border wh raised mounds of sandy soil, and even in this my is attractive. A few atones placed ander the trailing shoots keep them clean and free from grit.

\section*{H. Moserianum \(x\).}

This is a choice abject, very mitable for a roden or border, lating in flower a long period of tiw It is an erect-growing hardy variety.

\section*{Lamiur aurbum}

Is a uteful plant for covering a flat aurface, wh as it name implien, it is a yellow-leaved plant in thought highly of here, and is a capital gromive Work plant where Dutch bal

\section*{NOTES FROM CAMBRIDGE Botanic Garden. \\ (Consinu:d from p. 518.)}

Dipladenia boliviensis on a rafter in the plant atove, and the Yam in fruit in the same house, prenented a striking contrat, and are plante too seldom ased for effect on the roofa of glans-housen. Some fine specimens of Ixoras, very notable among them being a fine piece of 1 . Bandhuca, of a very deep acarlet, light up the plantatove with fine glowing tints on the eve of the November fog*

Pellionia Dateauanata,
The semi-auccalent stems, peculiar foliage, and the contrast in colour, nize, form, between the male and female flowers, give this plant mont remarkable appearance. It makes, in fact, a aveful and novel addition to our stove creepers.

\section*{Dichorisandra thyrsiflora,}
is one of the best of this unefal order of showy and eacily-grown stove plants, flowering freely under good caltivation throughout the summer and autumn. The deep golden anthers bring ont to the best effect the rich dark blue of the flowers.

Crropegia Sandersoni and C. stapelieformis.
It is worth while for all lovers of netare to reat awhile in such Botanic Gardens an those of Dablin, Cambridge, Oxford, \&c., to have a half-hour's fellowship with some of the many curious and inatractive plants that are all too prone to be trodden under foot in our hot haste after mhown, decoration, and profite, in thene modern days of fever and excitement. Horticultare is fast losing its bigh character of the leinare cult, but carefal atudy of Ceropegias might do something to help us to regain it.
Ceropegias are eldom or never found in private gardena, they are of little or no use for button-holes, wreathe, dinner table decorations, or market flowera.

Ponibly few practical men know that the literal rendering of the name is a fountain of wax. And the design, form, and uses of then fountains are miracles of constructive denign and adaptations of means to ends. The whole structare of the flower neems designed to protect the atigma or orary from wet and the inroad of fies and other insects. Ceropegins are not ranked among fiy-catchers, though the atractare of the blossoma are so peonliar, that ahould any living thing get into the corolla it wonld atand bat a poor chance of getting out again, whether the fountain on the top or the tabe at the bottom were filled with honey or not. In some apecies, fach as C. Sandersoni, beantifally in bloom at the time of my visit, the five petale formsd a raised tent, supported on five open archos, that wind round the top of the bulgedoout portion of the tube; so that any living thing that geta into the well-lighted, carefully-guarded, life citadel of the Ceropegia has a raied palace on the roof with five windowe, each a quarter of an inch deep, to look out of - a tower of observation, or mayhap allurement, probably nnequalled among plante. The five potale diverge from a centre to a point in the centre, and the extremities overlap thene arches like ambrellas anfficiently far to render each flower waterproof. The colour of C. Sandersoni is a pale green, mottled and veined with a darker green, with a beantiful pecaliar translacid appearance. C. stapelixerormis is a parple-fowered amaller variety. Both these are greenhouse plants, and could be grown easily, where their flowers could be beat seen, climbing up or drooping down from a roof, pillar, or rafter.
C. elegens is, perhaps, best known; bat this being a native of India, need the warmth of a atove to do it jastice. This apecies has also purple flowers, and long hairs clothe certain portion of ita very carious flowern. All thene apecies and most others are climbing plants, requiring to be trained on rafters or trellisen. They are eanily propagated by cuttinga, or root, or stem, or bulb division, for the species that have bulbous roots.
To bloom them freely the tope nuwat be kept fairly thin, freely exposing them to light and air. They thrive best in a mistare of peat, leaf-mould, and and. One or more plante should be grown in every glasehoune, as few plante afford more iaterent and pleasure to families and etadenta than auch wax fountains or tent flowers an Ceropegia Sandersoni.

Gerbera Jamesoni.-Oa the occasion of a recent visit I was much pleased with nome specimens of this still rare and atriking plant. It weems it was firat introdaced from the Tranavaal by E 'hman, in 1878. It was sabequently found and sent home by Mr. Jamenon, whove name it now beare in the gold-field dietricts of Barberatown. Hitherto, its progress under cultivation has been rather slow. I do not remember, in fact, seeing this striking and beautifal plant in robust health and fall beauty anywhere else bat in the Cambridge Botanic Garden. (S8e Gardener' Chronicle, June 22, 1889, fig. 122, p. 773 )
Mr. Lynch, with his unall courtesy, supplied me with a few notes that must prove exceedingly uneful to others who would like to grow thin very ornamental plant to perfection. It is grown at Cambridge in the open air, bat it is not quite hardy nevertheless. Neither does the Gerbera take kindly to pot caltare. Hagging the south onde of the nice uneful new range of glase in the Cambridge Butanic Garden, may be found several hardy bulbs and other plants that have the full beneits of all our solar heat, and considerable belp from the hot walle of the plant-atoves and Fern-houses behind. Amonget more of auch plante is a fine group of Opuntian, most of which survived the zero frote of hat February. I do not any that anch tempting food for frost wholly escafed, but a fine group still aurvizea, protected with a temporary frame of glase in winter, and mayhap, bat I am not aure of the latter, a mast over the glase.
It was a happy thought of Mr. Lynch's to plant the Tranuraal Gerbera behind the Opantin, and clowe
to the warm wall behind it; and here it may be said to grow like a wead, blooming peraintently from April 1 to the middle or end of October. Mr. Lyach thinke the Gerbera and Opantias mutually protect and ansist each other. Both have a glact covering to keop them dry rathor than warm in winter. He aleo adde, at already ateled, it does ac well here because it is plated againat a wall, behind which are four hot-water pipee.
The general appenrace of the plent is momething like an enormous Dandelion, with large flameecarlet Daiay-like flowers, atanding ap atrongly on flower atem averaging from 1 foot to 18 inches or more in length. The provailing colour is a uniform flame-acarlet, bat the colour varios conaiderably from seedliage, some having a decided shade of salmon. The blooms alao vary very much in size, the blooms being freat in ennoy fine summer westher, some of them sbowing acarlet single Daisife, meanaring as much as it inches across. The peraistency of the blooms after catting is even more marvelloun than their perpetaal blooming from April to October inclusive.
In this genial home for this atriking plant, seeds are plentifully riponed by Mr. Lyuch, who kindly adde, that by mowing thene in a warm houe 30 soon as ripe the plante are ready for dietribution or planting out in the spriog; thowe who have aeen this plant in good form can hardly doubt that it is bound to have a brilliant fature in many gardens in ite preeent form, and may prove naefal to bybridiats. of Daities, Caryeanthemums, Dandelions, \&c. D. T. F.

\section*{FLORIST8' FLOWERS.}

\section*{CHRY'SANTHEMUM GOLDEN WEDDING.}

Manr complainte were made last season concerning the wearness of constitution in this variety, and the failure of the plant to flower satisfactorily I had not grown it, and determined to try it this seanon. I have found no difficulty whatever an regarde ite conatitution. The planta wore late when I received them, which account for the bud showing late, and the flowers are only now (Nov. 14) half expanded, but the plants are certainly healthy and atrong, I am very pleased with the flowern, which are of a rich golden-yellow colour, in that respect clonely remembling Jardin den Plantes. The petals are broad and of good sabstance, and I thall expect to see this variety come eventaally more to the front. W.H. Divers, Belvir Cautle Gardem, Grantham.

\section*{The Austoula}

The plante show a remarkable tendency to damp-oft in the late autumn, the outer leaver rapidy decaying and if thee ba not removed, frequently the main atem is apt to decay as well. The alpine varietiea are equally liable to be thu injared, and these effecte are not confined to plant grown under glan, but are seen in the plants in the rock-garden. When removing decaying leaver, no trace of decay should be left on the plants. Many of the show varietien are very scarce, and duplicaten cannot be obtained, and it is therefore advisable to avoid lones. The plants should be arranged in a certain kind of order, beginsing, nay, with the green-edged flowers, and following on with grey-edge, whiteedge, and selfs, this being the order in which floriats have always anranged them, and a carefal fancier places his choicer apecimene in the bent ponition he han for them, and where they are ander his eye, and eanily come-at-eble. The plats thould at this meason be as near at poseible to the glase, bat thould not touch it. In fine weather the lights should be removed daring the day, and replaced in the evening as aoon as dew in noticed on the leaven of the plants. In foggy weather let the lighte be kept clove. After foggy weather the glas, if the garden is auburbav, will be costed with a black oily sabatance, which must be wanhed off, bat the plant will not have uffered. The plant frames, Which have been in a shady position during the aummer, should be placed in an open position.

Watering mast be done with care, affording no water if a plant be not very dry, and always keep the leaves from being wetted when applying water.

\section*{Carmations and Picoters.}

Tho who have to deal with a large collection may not always be able to do this, that, and the other at the proper time-indeed, during the last two or three years I have been obliged to atep outaide the rules and regulations often laid down for myself and othera; but, as \& worthy man and good old florist used to asy, "What odde? you're aye learning something." And herein he was quite right. For instance, I have always been anxious to get the border Carnations planted out before the end of September, and yet I have had aplendid anccess from plants put out after the middle of November. I began this year to plant out the choice border Carnations about the middle of November, and an I write they look very promising. A little decayed manare will be spread over the surface as aoon as front sets in. I plant three of one wort together, and the clamps are 2 feet asunder, measuring from the centre of the three. Seedlings, again, ought to be planted out where they are to flower in June or Jaly, but this cannot always be done. I plant them 15 inches asander, but the ground was not available this year; therefore the plante were put out \(7 \frac{1}{3}\) inches asunder, and now, when the ground has been cleared, every alternate row is being removed, and the alternate plants in the rown, leaving the remainder at the regulation dintance, and filling up the rent of the borders. They were removed carefally with a masa of roote, and do not seem to have suffered in the least.
We have not yet finished up the potting of the lajers, although we began early in October, and one of the very bent northern growert has juat written me to any that he does not find his plants suffer in the least when he can get them potted before Christmas. This, of course, would depend a good deal on the voseon, for sharp fronta are not uncommon in Dacember, and they may alao last long ; atill, it is well to know that layers may be potted up, and plants may be set out in November, and atill ancceed admirably.
The plante early potted-up in framea require to be carefully gone over, all dead and decaying leaven removed, green-目y bruahed off, and the aurface of the soil atirred; weeds also will have appeared, and ahould be removed, placing the plants on a freshlyatirred surface of ashen or cocoa-fibre.
In some districts apot is troablenome, but if any plante show signs of boing injared by it, they should be removed from the frame into the greenhouse, Where it is not no likely to epread. The rant, as it is termed, is not affected by atmosphoric conditions, and mast not be played with, but the affected leaver cat off as soon as remarked, and the planta watched in case it might reappear. Cleanlineas is important in the frames, and greenlly must on no account be permitted to increase. It makes a and mess of the beautiful folinge.

\section*{Pinss.}

The hardy garden Pink in all ta beantifal varietien, is a plant which ahould be found in every garden. Many of the very choicest Carnations lack wcent, but the Pink never. I have read mont that the late Rev. George Jeans wrote upon the Pink under the signatare of "Iota," and he preferred the flower to the Carnation; and I once heard a leading forist declare at the luncheon after the Birmingham Carnation Show, that the Pink was certainly to be preferred to the Carnation. What we want is raisers of new varietien. The Carnation has plenty of worahippers and'produceri of new varieties, and we ought to get out of the atrict groove in Pinks as we have done in Carnations. There is too mach samenens in the laced Pinka, and it requires an expert and welleducated eye to distiaguish one from another.

We may in time get selfs of various colourn, and if mach can by obtained, the Piak will again become as popalar as it once was an a garden flower. My large plants for foreing are now well eatablinhed in 5 and 6 -inch pots in garden framen, For forcing, the laced
varieties are not as well adapted an self, as the flowers do not then come furnished with lacing, or even if grown in pots. The open air, no shading, and no glass protection of any kind, afford the mont perfect laced Pinks. The earliest of the plants may be pat into gentle heat forthwith, keeping them close to the roof-glasy, and taking care that they do not lack water at the root. Plants in the borders should be made secure after frosts by prensing the noil firmly about them; and if any of the leaves aro eaten by alugs, \&cc., hunt for the depredators, and kill them. Jas, Douglas.

\section*{Ter Hollyhock.}

There are evidences that the stately Holly hock is once more upon the plane of improvement. At flower-shows held in various parts during the past summer and early antumn, at which floriste' flowery play an important part, I have reen the Hollghock in better condition than usual, ahowing not only that it is better grown, but that there are better varietien. The dinease which caused the loss of so many fine varieties is not now so virulent as in former yearn, giving confidence to raisers of new varieties, so there is hope of the Holly hock becoming a garden favourite once more. At Saffron Walden, so long associated with the labours of Charles B. W. Chater, Mesarr. Webb \& Brand, the succesiors of the latter, are promoting a. Hollyhock revival with conspicuon anccess, and they have some of the old favourites of yeare ago, which encaped entire annihilation atill under caltivation, such as Alba superba, one of the beat white varieties ; Alfred Chater, clear rose; Amaranth, a new variety, of high quality, soft amaranth-pink, full, and of the beat form; Bijou, acarlet, tinted with buff; Carus Chater, crimson-scarlet, bright, and extra fine; Fire King, bright reddishcarmine, extra fine; Malberry Gem, a very dietinct variety, in colour a rich glowing Malberry ; Golden Drop, a fine self, yellow; Primrone Gem, woft primrose; \(N y m p h\), white, tinted wich delicate pink; and Walden King, one of the beat of the old varietien, deep crimson. It will thus bs aeen that the choicer named Hollyhocks of the present day exhibit a wide range of tint and combinations of coloar.
The propagation of the Hollyhock is a work of much interest, and to all appearance is most auccessfally performed by those who make the cultare of the plant a epecialty. Grafting is the most commonly followed method, and \(i t\) is performed by Mears. Webb \& Brand both in autama and apring, the autumn being the time most preferred, if good shoote are obtainable for the parpose, which is not almay the care, eapecially when the plants are allowed to aeed, the production of seed appearing to delay the patting forth of growthe from the roota which form the cions for grafting parposes. Grafting is done on to the roots of strong-growing eeedlinge. Badding may be saccensfully done during the summer months, mach in the way that Roses are budded on to the seedling Briar; bat it in hardly antisfactory, as it is found in experience that the badded shoots commence to flower to very low that they acarcely form a apike of any length.

The antumn-grafted plante are put into pote and placed in cold frames; they are kept clone for a time until growth appears, then air is given, and in this way plants are obtained for eending out in the spring.
Sseds of fine atrains of Hollghocks have been somewhat scarce for years past, but always in dumand. Some sow in January in heat, and the plants, if well cared for, grown on into aize and planted out in good ground, will fower in the autumn. The atrongeat and mont astiofactory planta are obtained when treated as biennials, the reeds aown in Jaly in the open ground, and transplanted in the autamn to flower the following summer; nach plants always produce larger bloome and finer apikes, and are better fitted to suatain the attacks of the disease than those raised from the winter nowing.

It may be added that aeed taken from any one variety will frequently come quite true to character,
and if not fally reprenentative of the variets, alanats
invariably of the ame tint of colour.
That Hollyhocks can be succesfully grom, and fine spikes produced daring the aummer month, in conclusively shown in the seed trial groment of Messry. Satton \& Sona, of Reading. The phant of put in deeply dug, well-manured ground, and ane fully watered and malched during hot drying mather the plants grow strong, tall, and atately, dereloping fine spikes, some of which being of very fue quality rival those ahown in days of yore. The Hollighoti not a difficalt plant to grow, but it is one that mat have good culture in order to succeed. \(B_{1}, D\)

\section*{Nurbery Notes,}

FISHER, SON, \& SIBRAY, HANDSWORTE, SHEFFIELD.
Ir was with feelings of relief that I left babind mo amoky Sheffield, and journeged out to the rilluat of Handaworth. Though so rural, Handeroth it within the city limits, and is readily acceuibo by several meana, and it would be a village of a ordinary character were it not for the extanine narneries of Mesurs. Fisher, Son, \& Sibray, Limiter, which formed the object of my vinit. On entaring the nurnories at the main gate, the firt house puad into was one with a large apan-roof, which has ban recently rebuilt, and is now intended for a home houne.

Orchids are particularly good, nevernal hown being devoted to their cult ure. Cattleyas and Latim bristling with sheaths, Dendrobiume, Cologyme Cypripediums, and Odontoglonsumi, were well reprow sented in all the best apecies and varieties. Them was a grand batch of Dendrobiums in 4 -irch poth some having as many as nine atrong gromth; wit those on wood blocks were equally fine.

Suspended from the roof of one of the honam me Nepent bes Hookeriana, N. Mastersiana, and inled most of the best apecien and varietien. Effdilind arranged on the atages beneath thene were Alowis Watconi, A. Sanderiana, A. Lowii, and others; tho a very fine plant of Cyanophyllum maggiifcurn, the moist air required by the Nepenthes exsecty nititus its needs. Crotons occapy a particularly well-lighted honse, and are given a very high and moint tampe ratare, and the growth and coloaring of the foling are simply aperb. Flamingo, Baron Jamed of Rothachild, Madame Chas. Heine, and Manngame were eapecially conspicuous. The cleanlinen wil vigour of these plante were remarkable.
Amonget other stove-plants the Dracerna, Frelire ris, continental varieties of folinged Begoniun, ul Amasonia panicea were all noticenble for their poil condition, an ware anch climbers an Allamanith Ariatolochiaa, Dipladenias, and the Staplumelid floribunda (Handsworth variety).
Both atove and gresnhouse Ferna receire mex attention; the following being a few of thon wadity of notice in the atove nection for their phimer form:-Davallia tenaifolia, Pcerin tricolor, Adinficial ouneatum variegatum, \(\mathbf{A}\), macrophyllum, na Lathami. Ia the greenhouse section, Toden Fruma T. pellacida, and grand maseer of the rith a the Fern (Trichomanes radicans), togethor midiana batch of the Venus Fly-trap (Dionaen Macipasi) id deserve pecial mention. A notable howe in large Palm-houne, which contains all the chi 10 㑕 species of Palma, ranging in height from 2 to 1 Underaeath thene, so as to economine appet, comb large quantity of Pancratium fragranah cuin Kontias, and other Palme sre raied from the and planged in cocoa-nat fibred with genill hell they soon make plants of a auitable aize for tw decoration. A large double span-roofed hone tains Palms, Arancaria Napoleon Bnamutin excelea, Dacrydiam Franklinii, \&cc. kept quite apart from the sale planta for deention purposes, the firm entering largely into thim bamber

Boavardiav, Azslea indica, Tea Rones, Groentivith and Japanees Rhododendrons, Cnnum, Bp

Camellias, \&c., were all the beat of their kind, Marguerite Carnationa were perfect, and it hat never fallen to my lot to see a finer show of bloom in all shades of colour. Of course, the are only flowered inaide for seeding parposem. Ssed sown early in the season will ensure plants in fall bloom in Jaly and Angust, many of which are almost equal to florist's varieties. Saveral houses are occapied by Lapagerias in different atages of growth, notably L. gigantea, L. alba, L. maculata, and the celebrated red variety, L. profun. These are all produced from layern from plants planted out in convenient borders for this eapecial parpose.

Four houses are set apart for the caltivation of flowerk and foliage for catting, and a very praiseworthy rule is rigidly enforced, viz, that no flowers, \&c, are to be cat in any other houses. Theis
of the Grecian variety, and nome large-leaved varietien not yet in commerce. Evergreens, wach at Aucubas, Prunus ceravas var, rotundifolia, vars. Intifolia and cancasica, are numbered by thousand. Owing to the Aucubar being liable to injary from front, it in the practice to transplant them in August, the object being to ripen the young growth.

Fruits.-Fruit trees cover some 60 acres; Peaches, Nectarines, Plum, Cherries, and Apricots, dwarf and fan-trained, were all very good; and of eapalier and pyramid-trained Peare, the atock is a very fine one. Standard Apples, Pears, Placos, and Dammone, wore all clean-grown capital trees. Particular attention, I was told, is paid to the aelection of atocks for budding and grafting, and where necessary, double-grafting is carried out to ensure fruitfulnest, examples of which may be observed in the plendid speclmone of Bit-

\section*{FLORICULTURE IN HANLEY.}

Tan ponibilities of bearatifying and decorating the tarroundingt of the dwellinge of the working claseet. and, indeed, those of more pretention domiciles, are shown by several working-men retident in IIsnley. A striking instance of what san be done in this respect is shown in the little plot of garden at the rear of the renidence of Mr. G. Bowerling, the chairman of the County Borough of IIanley Chryeanthemam 8ociety, 27, Windsor Street, Hanley. For many weeks it has been the admiration of passer: by. The wealth of bloom, the freah, green appearance of the foliage, and the variegated coloure of the plants, made one of the prettieat picturen imaginable. The Mayor, who recently paid a visit to Mr. Bowering's resideace, and

Fig. 106.-a town Garden, hanley, staffordeare
contents, at this season, consist principally of Smilax asparagoides, Odontoglossum 7 , Adiantum cunestum, Aparagus plamonas, A. defexus, Tabernæmontana, Cologynen, and early-flowering Chryanthemums. About half-a-dozon houses and numerous pits are devoted to the propagation and growth of Ivien, Ampelopair Veitchii, Clematis, \&c.

In the herbaceous and alpine gardens namerous bed were noticed which have been planted with the best varieties of Narcissus. Coming to some thousand of tree and bush Ivies in variety, which are such invaluable town plants, I was told that there is a great demand for these plants. Hybrid Rhododendrona, Ghent and mollis Azaleat, were also here in their thousands, and particalarly well set with flower-buds. Tea and dwarf hybrid Roses in pote, and atadard Roses, took up several acres, and could acarcely be aurpased for general excellence. Handsworth has long been famous for its Hollies, and at the present time there is a large ntock of fine plants
marck, Gaecoigne's Seedling, Peasgooa' Nonach, Lord Darby, and other varieties of Apples. Whether it is the natare of the zoil, or the constant use of the hoe, the trees when lifted show great masses of fibry roots. Gooseberries are grown in hundreds of thousands. Immense breaks of black Carrante, particalarly Baddenborg's Black Prince, the growth of which is something remarkable, were observed. The wanta of cuatomers in the way of Strawberrien are not forgotten, a large breadth being planted with the bent varieties for trial purpones, and also for obtaining early layer. A large tract is almo net apart for trials of vegetablen and farm seeds; and another very important feature is the seed department, the firm during the 150 years of its exintence having alway been noted for ite reliable seeds.

The area of these nurwery grounds is abont 200 acres, and every portion of the land is under some kind of nurnery crop, park and forest treen forming no small portion of the same.
expressed his pleanure at the charming appearance of the garden. Mr, Bowering is to be congratulated on his taste and perneverance, and if his example only tend to show what may be done to brighten our dwellinge, he will have done a great deal to encourage others to follow his load. Steffordtive Weekly Pout, September 7, 1895.
[Thil garden, of which a photographic view was kindly farnished by Mr. Jas, Kent, euperintendent of the pablic park, Hanley, is reproduced in 6g. 108. Oar readers will not fail to notice and admire this garden, situated in the beart of thit not very alabrious pottery town of 60,000 inhabitanta.]

\section*{RANUNCULUS CORTUSE. FOLIUS.}

Snon I received a Firat-class Certiffate and \(\mathrm{Ca}^{1}-\) tural Commendation for the above plant from the Royal Horticultural Society, I am conatantly beirg
atked by correspondents an to my method of cultivation, and a few remarks in the Gardeners' Chronicle will probably auffice to answer them. (See Gardeners' Chronicle, 1892, April 9, p. 465 ) When growing in pote, I tae the following compost for the plant, viz., three quarterm loam, one quarter leaf- monld and rotted dung, with sufficient sharp and to keep the masa poroup. The tabera should be potted about the end of the month of September, one tuber being placed in a 16 -nized pot. The potting should be firm. Stand them in a cold frame, with abundance of air, afford water juat nafficient to keep the soil moist till growth commences, when, provided the drainage is good, they will require abundance. As the pots fill with roots, manare-water should be afforded once or twice a week. At that time the plantes ahould be taken to an airy honse not pervioun to frost, and a sharp look-out kept for green-fly, the leaves and flower-buds being very soon disfigured by these insecta. The plants usually come into bloom by the beginning of the month of March. After flowering is passed, and the leaves are ripe and turning yellow, water should be gradually withheld, the pots being laid finally on their wide out-of-dours till potting time again comes round. The most important time is after the flowering is over, attention being required to be given to the thorough ripening of the tabers, withont which success is doubtínl. The odour of the fowers resembles that of some of the Vandas. C. F. Wood, Heathfield Gardens, Reigate.

\section*{THE FLORA OF KASHMIR.}

The report on the valley of Kachmir, by Mr. Walter R. Laurence, the Settlement Comminioner for the Kashmir and Jammu State, which has just been issued from the Oxford University Press, contain matter which will be of much interest to the botanist, the horticulturist, and the agricultariat.
Mr. J. F. Dathie, the Director of the Botanical Survey of Northern India, ham furnibhed the report with a list of the plante which may be found in the neighbourhood of Gulmarg, and this list is of especial value, neeing that no list of planta of the Kashmir valley has as yet been pablished. In dealing with the Flora of the Kashmir valley and its mountains, the commissioner has confined his attention to those plantr and trees which possess nome well-known economical value for the people. As the Kashmiris turn nearly every plant and tree to mome use, and attribate medicinal properties to every growing thing, it will be seen that Mr. Lanrence's task was by no means an eary one.
The various indigenous plants and trees have been grouped under their several economic ases and properties, and there are fourteen division in all :-
\begin{tabular}{l|l} 
1. Condiments. & 8. Medicines. \\
2. Drugs. & 9. Poisons. \\
3. Dyes and Tans. & 10. Scents. \\
4. Fibros. & 11. Soap and Alkali. \\
5. Fodders. & 12. Timber \\
6. Foods and Rruits. & 13. Yeast. \\
7. Hair-washes. & 14. Adulterants.
\end{tabular}

Kammir in very rich in fibres, and the native make great use of them. Mr. Laurence thinks that it is posnible, as communications with India improve, a trade in fibres may be developed, as every year wepe a great wate of valuable fibre-yielding plant:. The boatmen of Kambmir require ropen of geod quality, and it is atated that for towing-ropes the cotton fibre in the bet material.

The Barzs or Paper Birch is of great importance to the Kashmiris, the bark being used to perform the dutien of rough paper, and the roof of all the better class of housen and of shrines being formed of Birch bark, on which a thick layer of earth is laid.

Kashmir in rich in Gransen, and the boundaries of the Rice-field furnish a fine crop of hay every year. This hay is twisted into long rope which are unpended from treem, thus protecting the hay from the weather. On the lake and swemps of Kashmir, the following food-plante are to be found growing wild:-

> Water Cheat
Waver Lily
> Sacred Lotiu
> Sweet Fhas

Of the fruits of Kabmir, the following are indigenous, and are found in all part of the valley. Mr . Laurence naya their fruit is not 50 good an that of the cultivated trees, but that it is by no means to be despised. The Malberry, Bitter Cherry, Plum, Apple, Pear, Vine, Walnut, Pomegranate; the Raspberry, Blackberry, Bramble, Strawberry, Gooseberry, Red Carrant, Black Currant, Bird Cherry, Barberry, Eiæagnus, Beam tree, Hazel, and Gueldrea Rose. The Raspberry and the Curranta are, according to Mr. Laurence, equal to the cultivated varieties of Earope.

The Kashmiris take great paine with their hair, and beaides using batter and oil, they employ numerons plant for this purpose. To atrengthen the hair, they uae the powdered roote of a plant known Zonir, mixed with batter; and to induce a curliness of the hair, they employ a wash made from Corydalis Falconeri. Mr. Laurence gives a list of the more common medicinal herbs, bat the taak is a difficult one, for the hakims of Kashmir, the native phydicians, attribute ome property to every plant. Many plant are used for acents, the most important of the aromatic plants of Kashmir being the Saunarea [?].
Kashmir is rich in foreats, which produce a great variety of timbers, the most valuable being that of the Deodar. A Department of Forestry ha lately been formed under the sapervision of a Earopean forest officer, and it is hoped that the indiscriminate and wanton destruction of forests, which has been allowed to proceed for so long, will cease. It is a curious fact that no Oak occur in the valley and its mountain aidez, and that no specimen of the Himalayan Rhododendron is known in the valley of Kashmir.

Mr. Laurence's book in a valuable contribation to the economic flora of India, and we trust he may some day find time to puraue hie researches on the botany of the Kanhmir valley a little further. \(H, C, F\).

\section*{The Week's Work.}

\section*{THE KITCHEIV GARDEN.}

By Johin Lambert, Gardener, Powis Castle, Welshpool.
MANURING, TRENCHING, AND DIGGING.-An effort should be made at this season to trench as mach of the kitchen garden at possible, in preparation for next year's crops. The manure should be carted or wheeled by hand as near as possible to the land to be dug. In large kitchen gardens it is asual to have the walks of anfficient width to admit of a horse and cart, and if the wheels are broad and a little attention be paid to cleaning the tyrea of soil when coming off the land or from the danghill, it is much the more economical practice. The edging is got over by mean of a atrong kind of low bridge made 2 feet wider than the cart. The work of carting direct on to the land should never be andertaken except when it is dry or frozen. In garden which it is customary to trench to a depth of 2 to \(2 \frac{1}{3}\), or 3 feet, put the top pit into the bottom of each trench, the noil at that depth is equal to the top in fertility, and may afely be brought to the top. I think \(2 \frac{1}{3}\) feet is deep enough to dig for most purposes, and in but few gardens is the bottom soil equal to that at the surface, unles it has been placed there when trenching the land. In case the soil at the bottom is not so good, batard trenching is the best way of doing the work. In bastard trenching, the soil at the bottom of the trench should be brosen up, manured, and dressed with lime or soot, or both. The lime and soot should be intimately mixed with the moil, and the manure go just beneath the upper apit on the top of the shovellinge, which ahould not be lens than 2 inches thick. If the land is retentive and atiff in textare, it may be ridged. For my part, I do not find much adrantage in this method orer flat digging, provided the surface be left ae it fall from the spade. Land badly infested with wireworm, or in which Cabbage club, shonld now be dressed with gan-lime, one of the best remedien for the purpose; and the present is the best meason to apply it. Gas-lime, as it come from the purifier at the gas-house in lumpy and adhenive, needing to be broken up and pasaed through a fine acreen or sieve, so as to distribute it in finely comminuted particlen over each spit of trenched or dug soil. It may be ased at the top or bottom at the rate of one bandful
to one superficial yard. If gas-lime be used at thit rate or lean each year so long a the land appearin to
need it, mach good will be effected. A dresning mas need it, mach good will be effected. A dresing may
be used of quite this atrength over the anfocig entire garden, and it may be uaed among almot nay kind of crop if uned with due care and in a fine ante.

\section*{PHE ORCEID HOURES.}

By W. H. White, Orchid Grower, Burford, Dorking.
PLEIONE8, OR INDIAN CROCU8E8.-OAR planto of Pleiones have been very gay for the pur for weeks; and, considering the ease with which they can be cultivated, the large number of the fomen they produce at a dull season, and the benatifal effect afforded when they are used for decontive purposes, space should be fourd for a number of tho plants even in as small collection. By the time this note appears in print, \(P\). concolor, \(P\). lagenaria, \(P\). Reichenbachiana, P. præcox, P. Wallichiana, P, msculata, and its almost white variety, albs, will bo going out of bloom, and the carefal observer will note that the green shoots from which the flowen sprang are in reality new growths, which under proper treatment form atrong flowering preadobulbs. This treatment consists in affording frew rooting material to the roots, which start from the base of these new growth. As regards repotting Pleionen, it is not necensary to diuturb them annually, unless the noil ha: become souted, as they may be grown in the ame pots for a couple of easons and atill produce plenty of bloomh It is immaterial whether ordinary shallow pane or pots be used, excapting that pans are best where space is limited. Whichever be used, plenty of clens crocks should be afforded, as copious wateringa are required by the plant during active growth. Over the crocks a thin layer of phagnam-mons ahould be placed, for the two. fold purpose of keeping the compont aniformly damp and the drainage unclogged by will. Turn the plants out of their pots or pany, removing mont of the atale soil, and catting off all roots which are dead; and instead of dividing the pseudo-balbs and bedding them out, as is often practiaed, I amply repot them in clamps almost toaching each other, and merely pull off those which may have grown beyond the main mase of the clumpi, which maj be ased for increase of stock. The compost should consist of equal parte of fibry loam, peat, and aphagnum mona, well mixed with a moderate quantity of coarne silver and. Some growerm make ute of mixture of peat and leaf-no 1 , asnd, and finely-brokeil crock: with equally good results ; and I have ocivsionally observed plants doing well in ordinary pest and sphagnum mons. Wherever it is ponible, the apaces between the pseudo bulbs should be filled in with the roughest portions of the compost, giving preference to sphagnum mons as being retentive of moistare. When repotting is finished, the plank should be placed near the roof glan in any howe having an intermediate temperature, and be afforded acarcely any water until the joung growths atart to grow vigorously; and as the roots and foliage develop, to must the quantity of water afforded be incressed, was liquid-manure water being applied once a wed after complete re-establishment. In addition to toon varieties mentioned, there are P. humilis, P. Hook ians, and its pretty variety brachyglossa which como
from greater elevations, which do beat whon hugu clome to a elevations, in the Odontoglonaum-howe that is commonly left open. These specien generally flower about Ja nuary or February, therefore till thej have done so they should on no account be distarbec but kept in the cool-house and afforded water frim cient in quantity to prevent the pseudo-bulbs fro shrivelling.

\section*{TES HARDY ERUIT GARDEN}

By W. Pope, Gardener, Highelere Castl, Neworry.
FRUIT-BUSH PRUNINQ, ETC.-The pruning of Cooseberries and Curranta may now be carried of purring-in the side shoot on the former and \(n\) and white Carrants to about three-quartern of inch in length, and thinning out the ahoota and apule where mach crowded. To preserve the not basin shape to the bushes, branches show crosind allowed to cross each other, and one or Some ger branches or shoots should be cut sway. Sow Goone deners are constrained to leave the pruning of Gooug berry bushen till the apring, so as to encure buds to frait-bude being left for a crop, and shoot-bud form the bush after the birds have despoiled culd be and where this has to be done, the bushes shoul have bandled up faggot-wine an soon an the lesven bave fallen, which will prevent the birde gaining an ach
to any bat thowe at the outaide of the bundle. If the pruning is performed early in the antamn, and the basher are dreaned forthwith with aoot and lime (which is beat put on rather thickly with a whitewashing bruth), no tird will touch them; even a good duating with dry lime whilat the wood is wet geta as a deterrent, but is not so effoctive as the lime and soot wasb, and it may require to be done a eoveral time. Black Corrants need a thinning of the older branches, and a reduction of the young shoots, encouraging the atouter young shoots that epriag up from the root. All sucker not required for this purpose thould be dag ap, and if neceasary employed for increase inatead of catting. In preparing cuttings of babh-fruits, choose ripe shoots of \(1 \frac{1}{4}\) to \(1 \frac{1}{2}\) foot in length; cut the bottom end tran averaely just below a joint, and the top on the alant. If clean atems are wanted, the bad mast be taken out from the lower part of the cutting, leaving three or four at the top to furnish the main branches. In the case of the black Currant, this method is not recommended, the fineat fruit invariably coming on the young wood, and this can only be obtained by means of the growth springing from the root. All cuttinge should be inserted as moon as made, if in mild weather, in row at 6 inches apart and the wame in depth, the rows being 1 foot apart, for the better convenience of cleaning the ground.

BULLFINCHE8, TRAPPING, ETC.-A harp lookout must be kept now for ballfinchen, ahooting or trapping them on their first appearance. In a few hours a couple of these pests will do an immene amount of damage on an Apricot or a Plum tree and where a good call-bird can be had, they may eavily be taken in a trap-cage, or they may be captured with bird-lime.

\section*{FRUITS UNDHR GLABB.}
by Riohard Parierb, Gafdemet, Goodhood, Chichertm. HINTB ON WORK IN GENERAL.-There bhould be no delay in carrying out the necessary cleaning, praning, and training of treen, Vines, \&cc., in the various forcing-hounen, many other jobs claiming attention at the new year, when less time, therefore will be available for doing the varioas operation thoroughly. All of the Peach and Nectarine trees should be pruned, and the young shoots tied loosely in bundles to some of the main brancher. Then proceed to wash every part of the roof and trellis. When the bhoote are thas drawn up together the gardener is enabled to use with expedition the gardener is enamproved inecticidea on the trees, benide thoronghly cleansing the rougher parts of the bark on atems and branchen. For scale I use nothing but clear water at \(130^{\circ}\) applied with a syringe on three or four anccessive day, and thin, if the water be copionsly uned, never fails to destroy cale. The fruiting wood may be washed with a large sponge dipped in a rather atrong solation of soft-soap and water before laying in, mealy-bug being lens easily dentroyed, and it in necenary to use petroleum at the rate of a wine-glaseful to 4 gallons of water, first having stirred in 4 oz . of roft-soap. To apply thi drearing, use an ordinary acrubbing-bruth, and repeat the application on three or four naccesnive daye. I do not advocate the coating of the Vines with clay, \&c., and would caution gardenera against the use of tar, au I have known Vinea so injured by this aubatance that it has taken veara for them to recover. Thoroughly warhing the Vines at recommended while in a dormant state, and keeping aharp look-out during the first few week after starting to force for stray bugs is a perfectly safe and are mode of deatroying this, the worst of all Vine-pesta we are acquainted with in this country. Fortunate are those who'like myself have no mealy-bug on the Vines, an well know the amount of labour entailed, and the worry caused when this pest is about. The cleaning of the Vine stems, hoots, \&c., is often entrusted to inexperienced men, who sometimenstrip off the bark too freely from the stem, which cannot be other than detrimental. Before the work of cleaning the houses and Vinen, \&ce, is begun, place a thick layer of atable-litter on the borders to abiorb moisture, and mitigate the evils of trampling on thom whist moist. By afterwards burning the litter in the open air, numerous insects are got rid of that may have fallen 'from the Vinen for treen. Finally, the Vines may be gone over with a paint-brush, the point of which is merely moistened with petroleum, and apply this to every part of the Vine except the bud's rougher outer portion, which should be removed, and this can be done by a sharp-pointed piece of hard wood or even an ordinary plant-label, and as it is chiefly
round the spura that the bug collecta, these parts hould be very carefully examined. Having cleaned the Vines in this manner, wash every part of them with hot-water into which petroleum in the above given proportion is mixed, and kept thoroughly and intimately incorporated at \(130^{\circ}\) of heat.

\section*{TEM TLOWER GARDFE}

\section*{By Blicer Wadds, Gardener. Birdall Gardors. York.}

THE BPRINQ GARDEN.-Daring mild weather the planting of Talipe, Hyacinths, Narcissus, Anemones, and other roots, the planting of which has been deferred, should be fiaished as aoon as possible, the bulbs, \&C., mucceeding fairly well if planted at any time during December if the weather permits, which it does not alway do, severe frosta setting in nometimen, delaying every kind of work. It sometimea happens that early planted bulbe pash through the noil if the season is mild earlier in winter and epring than is good for them, and when that is the care short manare or leafy soil should bo laid on to protect hem from frost. If the material used is such that it can remain on the beds without looking unaightly, and the bulbs grow through it, so much the better A keen look-out thould be kept for mice, which deatroy Crocas corms in the winter month enpecially at times when much snow lays long.

PANBIEB, WALLFLOWERS, PRIMROBES, POLYANTHUS, MYOBOTIB, DAIBIES, AND AJUQAB. The planting of these priag-flowering ubjecte may be continued, weather permitting, not forgetting to fill up gapa in earlier-planted beds, and choosing dry ather for this kind of operation. Pansies are often injured by wind, and they should alwaya be made secure by pressing the soil to them when the matter is dry. Rabbits and hares must be kept from these plante, for if they once get a taste of them, and the bede are not protected, they will make clearance of them. Late cattinge of Viola or Pansy, or seedlings that are being wintered in frames, whould have the lights removed from off them on fine daym, and abundance of air afforded at nighte; and the lights put over them as a protection againat heavy rain or frost.

CARNATIONS AND PICOTEES in frames hould have attention, very little water afforded till days get longer, and in fine weather the fulleat ventilacion night and day is needed. If the pote are not se jet planged in fins conl-ashes or cocon-nut fibre refuse, this should be done.

CALCEOLARIA, PENTSTEMON, ANTIRRHINUM If in frames, the plante require about the amo kind of treatment as the above-named throaghout ine ointer. The cuttings should now be well rooted the winter. The cattingen and nhould any of them show flower, an they will do when the ahoots taken were hard in texture, and bad to get, the flowers mut be nipped off with a pair of scissore. get, the fowersmunt do not require much water, atill They mrut not be allowed to become dry. It is a they mutt not be good thing to pat two handfuls of wood athes or burnt refuse in each watering-can when watering the beds. Afford abundance of ventilation to sll rooted cattings, and cover ap well againat frost.

CUTTINGB OF HOLLIE8 AND OTHER EVERGREEN8, and hardy deciduous shrabs, should now be taken, selecting ahort well-ripened shoots, with a portion of the older wood attached. They thould be placed in pursery lines at 1 foot apart in aand, loam, and leaf-soil, in a sheltered situation, the more tender varietie ach an Garrya elliptica, Skimmia japonica, male and female varieties; and Aucubs japonica, male and female varieties, should have the helter of pith or frames.

RO8E8.- In mild and favourable weather take cattinge of H.P. and other kinds of hurdy Rosen, the catting being taken before the buthet, \&cc., are praned. Rone cattinge should be made from short praned. well-iper border facing the west server as well as asheltered the cattings hould be placed in little any, and the cuttinga should be placed in litile trenches, \& foot or further apart, the to make a good number of cuttings, keeping each variety labelled and in damp soil till all are ready for insertion, and then the job can be quickly finished. Remove all eyes or buds from the portion that will be anderground, which applien also to all cattings of deciduons shrubs, or suckern will be source of veciation and troable. The noil about Rose-cuttings muat be made very firm, and levelled with the back of the spade. A Rose-catting should not be placed deeper than half ita length, and this thould be 8 to

12 inches. In hard weathor protect the bed with Fern or litter.

ChRYBANTHEMUMB. - The antuma-growing varietie that are planted in beds or borders whould be cat off near the ground, and in cold situation the old stools protected with short manure placed round the root-stock. Cattinge of each sort should be kept in pots under the sholter of frames, or in a cool house, daring the winter.

\section*{PLANTB UNDER GLABS.}

\section*{By W. B. Bxarin, Garderer. Weat Dean Park, Chrehester.}

PLANTB IN COLD FRAMEB.-Ia theee receptaclen, the herbaceous Calcoolarima are cultivated in mont garden until their removal to warmer quarter in necessitated by hard weather. The plants will require careful watering, and to be turned ronad every week, kept close to the glans, and have plenty of air afforded the frames in mild weather. The common white elage muat be carefully sought for, es they aoon gaaw and diafigare the lenver. When the pote fill with roots, some weak noot-water may bo afforded occasionally, eay once a fortnight. Bedding plants in frame require at this sesson acarcely any water at the root, nor will they do so for the next two month ; but should water be needed, see that it is afforded early in the day. In mild weather, ventilate freely at the top and bottom; and keep everything about the plante aweet and clean, and free from decay.
cinerariab. - These, if for a late diaplay, should be afforded some weak manure-water, if the pots are flled with roots, and fumigation if greenAy has mado ite appearance. Fancy Pelargoniums will need to be kept clowe to the glass, and allowed air night and day; and even in cold weather they hould not be quite anaired. 1)o not let them remain in one position for longer than one week, bu: tarn them round wholly. Stop all shoota when four or five leaver are made, doing so at one time, or the plants will break irregalarly. Pelargoniums being plants very sabject to aphis, should be fumigated once a month.

ZONAL PELARCONIUM8.-There, if for summer lowering, mas be potted into large 60's or \(48^{\circ}\) placed close to the glass in a pit or greenhouse, and when the roots have permented into the fresh soil the points of the lesding shoots msy be pinched off.

EABT LOTHIAN BTOCKB are benefited by being top-dressed with a small quantity of Clay's Fertiliser, and by having the pit-lights drawn entirely off in mild weather. Some of them may be placed on a shelf in a house having a warmth of about \(50^{\circ}\) by day to \(45^{\circ}\) by night. These will bloom early, and a Peach-house jut atarted is a very waitable place for pushing them on into flower.
border carnations.-These, if tanding in cold frames, will require scarcely any water for the next two monthe, but plenty of air day and night in mild weather.

WALLFLOWER8, if caltivated in pots, may be brought into an early Peach-house or vinery to be brought on into bloom by gradual forcing. Covent Garden Blood-red is a good variety for early flowering, it being a plant of dwarf habit, and the flowert of a pleasing bright colour. Wallfowers put into gentle heat at this season flower ia Febramy.

TREE PAEONIES IN POTB.-Theie are beautiful plant for cultivating for conservatory and greenhouse decoration, and if any of them are in need of repotting, the present is the proper time to do it. The pots uned ahould be about two nizas larger than thone the plant are occupying, and the pottingenoil may consist of turfy loam, leaf-soil, cow-manure in a dry state, and enough coarse sand at will leep th soil in a porone condition for a year or two. Pianta in an unhealthy state should have the old woil in an unhealiny clean away from the roots, and be repotted into clean pota of the mame or amaller size, and not allowed to flower till the second year after repotting. Plange them over the rim in fresh treelenves in cold frames, or plece in a late Peach-bouse or vinery. If the potting-soil is moderately paoist at the time of uaing it, no water need be afforded the plants before growth begins. Pasuies, when forced into bloom with heat, bould be brought on very gradually, or the flower-bads will fail to open; and the strongeat and best-rooted plante sbould bo nolected for this purpote. Grood varietien for growing in pote are Raine Eilizabeth, Madame de Vatry Blanche Noisette, Madame Callot, the Queen, lactea, Panicea, Beanty, Homer, sud Jupiter

\section*{EDITORIAL NOTICES.}

Advertsementa should be sent to the PUBLISHER
Nowspapers.-Correspondents sending newspapers should be carcofle to mart the paragraphs they wish the Editor to see.
Illustrations.-The Editor will thantrilly recive and select photographs or dranoings, suitable for reproduction in these pages, of gardens, or of remarkable plants, Rowerrs, trees, ce. but he camnot be responsible for loss or injury.

Local News.-Corresponients will greatly oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters which it is desirable to bring under the notice of horticulturists.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSU ING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEABS, AT CHISWICK.-41..2.

Artichokes.
To eat an Artichoke gracefully is so difficalt an accomplishment that punotilious people might well prefer to partake of the luxury in private Knives and forks are useless under the circumstances, and not only are the fingers soiled, but the heap of débris left on the plate is disagreeably suggestive, in its size, of a "kitchenmidden" or a rubbish heap. To be sure there is the delicate morsel from which all the scales or bracts spring, viz., the Artiohoke bottom, botanioally the "reoeptacle." An Artiohoke is botanioally a large Thistle-head, with its soales or bracts, its flowers, its Thistle-down or pappus, and its reoeptaole. The receptacle in most Artiohokesis relatively small, and apt to be mixed with the "choke," by which expressive name the pappus of the innermost florets is designated. Now, if the Artichoke bottom could be developed at the expense of the succulent matter of the scales, a great gain would result; and this great gain has, in a certain degree, been obtained, though it is so little known in this country, that we deem it desirable to call attention to the matter. At the Paris tables-d'hôte at this season, "fonds d"artichaut" are used with a freedom which shows that there is no soarcity of them in the markets, and that the price mast be considerably lower than it is here. Moreover, not only are they mach more abundant than Artiohokes are in England, but they are of thioker and more fleshy sabstance, and there is in consequence more of the toothsome morsel. Parsuing our enquiries, we luckily fell in with our excellent friend M. de Vrimorin, and from him we not only learnt all the particulars we
desired, but we were enabled to see the plant growing in his most interesting trial-grounds at Verrières, alongside of several other varieties. From this source was obtained the specimen from whioh our illustration (fig. 107), was prepared. The foliage is very distinct and handsome, but we must await another opportunity of figuring this. The scales or bracts of the receptacle are comparatively less sacculent than in the ordinary varieties, whilst the receptacle or bottom is unusually thick and fleshy. The variety is not altogether unknown in this country, and is mentioned in many of our garden oatalogues as the large green Paris Artichoke; but it is certainly less known than its merits deserve, and much less grown than the ordinary Globe Artichoke. Around Paris it is grown as the Artichaut vert de Laon (pronounced Lðnn).
It is very hardy for an Artichoke, with greyish leaves almost destitute of spines. The "heads" are, as we have said, remarkable for the depth of the receptacle. The ovate-lanceolate soales are wholly green or slightly tinted with purple at the base, at first closely packed, but subsequently rather spreading at the ends, and usually entire at the margin. M. de Vilmorin remarks that though not so early as some other varieties, it is the best for general purposes. No other variety has a receptacle so deep and fleshy. It comes true from seed, but is best grown from offsets.

Like the ordinary Globe Artichokes, it requires a deep, rich, moist, but well-drained soil, and it should be planted in lines about 1 yard apart each way. The sets are planted in spring, and will even produce flowers the first season, but it is better to await the second season's growth. In hot dry weather, water must be afforded, and in winter protection by mats or a thick layer of dry litter is essential After four years it is best to form a new bed, or in large establishments to arrange for a series of beds to come in succession. The prices asked in our markets ought to seoure ample remuneration to the grower.

The oultivated Artichole is not a distinct apecies, but a derivative from Cynara cardunculas, the Cardoon. Indeed, the Artichoke, as we know it in gardens, is not found anywhere in a wild state. The Cynara oarduncalus has been developed in two directions. In the Cardoon the ribs of the leaf have been developed, whilst in the Artichoke the flower-heads have been the objeots of selection. In the Botanio Garden at Tarin, by growing the wild plant from Sardinia side by side with the cultivated Artichoke, Professor Moris was enabled to prove their identity, and this view was supported by Professors Whlionm and Lange, who have had special opportunities for obtaining information. Alphonst df Candolle, in his Origine des Plantes Cultivées, shows that the ancients only knew and oultivated the Cardoon, the Artichoke, as we know it, not being introduced into Florence till 1466. It is donbtfal whether the anoient Egyptians cultivated the plant, and there is, it appears, no word in Hebrew or in Sanscrit for the Artiohoke, an indication of its comparatively recent introduction into oultivation. In this country the Artiohoke was oultivated in 1548.

One of the most curious points in the history of the wild Cardoon is its naturalisation daring the present oentury in the Pampas of Buenos Ayres, where it has spread with such abundance as to obstruct travel and traffic. It is worth enquiry whether the foliage of this wild or half-wild Cardoon might not be utilised for the salke of its fibre, and a nuisance thas oonverted into a blessing.

\section*{Epping Forest.}

The Expert Committee appointed loy the City of London Corporation, to repart on the Forest, met recently, for the purpose of inspecting the work which has been done, and report to the Chair. man of the Committee as follows:-

We have, again, very carefally inapected thon portions of Epping Forest upon which we had pre. viously reported, and we have examined the work w ich has been carried out since the inge of the report, with the view of aeeing whether it ma in accordance with the spirit of our recommendation,

We beg to make the following remark:-
Epping Thices.-This was the first point rinited. We were atruck with the beanty of the outline mhich hat been obtained by judicione cuttings on the fringe of the wood. We conaider that the mak done throughout this wood bat been good.

Teames Valley (Teeydon Bors).-Thin in an unsightly and monotonous portion of the forem, owing to the number of gaunt pollard Hornbeam. We con sider that this would admit of further clewing, and that portions might be advantageouly thinned out in large patchen and sown with 0 as, Beech, and other trees. As these grow up, further areas might be taken in hand in the same manner.

Treydon Coppice.-We have made one or two naggestion here to the Sa perintendent of the Fores with the view of opening out glades. Thereares number of young trees coming up through the coppies which are in danger of being choked. Thete bould be carefully preserved by cutting out mel portions of the coppice as are a source of danger to them. Thir course will enable this portion of the forest to asmume once more that natural aopect which the treatment of former year, when pollarding and coppicing were allowed, tas obliterated.
Back of Rigas' Retreat (Theydon Bois), -The thinning here has been moderate. We bave pointed out to the Superintendent placen where further action is necesary, with a view to improving the condition of some of the finer trees.
Theydon Hiar Wood.-Ia the northern portion of this wood, which consiate of Beech trees, there in -as a matter of consequence-no underwood.
We consider that the policy to pariue in thit portion, is to mark those trees which are mot worthy of premervation, and gradually to free them from any worse trees which may be injaring them. By laying down a definite line of action in this was, there will be continaity of policy independent of changes of officials.

The acathern portion of the wood may, we collnicer, be left alone for some years to come.

Broadstrood (Loughton).-We have made nome sugge ationa with a view to improving the outline.

Woodridden Hill - We have no objection to (ff r to what has been done here.
Verderers' Ride (High Beech to Woodeaddys), - We are of opinion that the glades which hare bet opened out bere might have been bolder and leil close together.

We have made nome naggention to the Sapeis tendent with a view to improving thene.
Claf Road, Loughton.-We consider that the breaking up of the straight line hat been judicionily effected, and that the reault in a great improvemat on the previous atate of thing. The thinning bus nowhere been excesnive.

Bury, of Hawk Wood.-There are a numberd pollard Hornbeam in this wood which should by removed. They are damaging the Oak trees; prevent the boles of the Oaks from being reed th their removal would improve the charscter of the wood. We attach great importance to retainiag 0 ak character of this portion of the foreat as nothing wood, and we would recommend that doarint further be done here beyond the gradual doarine out of the pollard Hornbeame.

Buaz Wood, Wanstead. - The thinning done het during pate jears appears to be judiciout.

Wanstad Pari.-The old E'ms, with nudur. growth of young Sycamore coming up beed the them, are the principal featare of this w
object of thinving was to remove ame stag-headed Elms, and those which interfered with the development of the Sycamores. No other Elms, unlens dead or dying, need be removed, as the Sycamore now bas anfficient light and air to hold ite own againat the Elm.

Walthaystow Wood,-In this wood a number of Hornberm pollards have been cat out in single trees here and there. Ia our judgment, a better effect would be obtained in future by removing such pollarde an it may be devirable to get rid of, in groaps, leaving other portion unthinned in the meantime. By adopting this course, a gradual return to a more natural condition of the woodland would be obtained, the artificial pollards giving way to natural and unmutilated trees.
2. It is desirable that when the plan is matured and approved, the execution of the work should be pleced in the hands of the Superintendent of the Forest, who ahould be responsible to the committee for the entire management of the forest.
3. At the present moment, the forest is in places littered with heaps of cat timber. This is very unaightly, and we atrongly recommend that arrangements should be made for the cat timber to be removed by May 1 in each jear.
A. B. Frbenan-Mitfurd.

Jamer Anderean.
Wh. Robinson.
W. Schlich.
A. D. Webster."
geometry and astronomy, and calculations of altitudes and auperficies. Mr, Baker thought the number of plants named at the date referred to was a matter of some intereat to botaniate, and sugzested publication of the list of names with their identification where posaible. Dr. D. Morriv, C.M.G., read a paper on the \({ }^{\text {"D }}\) D. velopment of a Single Seed in the Fruit of the Cocoanat Palm (Cocounacifera)." Alluding to the occurrence of Palm: with twin and trifid stem: arising from one base, it was ahown tbat these were due-(1) to several seeds in one fruit; (2) to more than one embryo in a seed; or (3) to a branching of the primary ahoot. In cases cited by Rumphias, Forben, and others, neveral seeds were found it ons fruit. The courae of development of the siagle cell wat illustrated by mean of lantern alides.

 THE THICENESS OF THE RECEPTACREQ. (SEE P.618.)

OAx Hict, Woodrond.-The thinning here hat been carefully carried out.
Katr's Cellab, Loughton.-This wood is typical of the large area of monotonous Hornbeam pollard which are unfortunately ao conspicuous a feature of Epping Foreat. The clearings are too mall, and too near each other. We recommend that, in future, they should be of a bolder type, and further apart.
Although it may not be exactly within the termn of our reference, we beg to offer the following remark for the consideration of your committee:1. We would augent that a plan of operations thould be drawn up, showing which aress it is proposed to deal with daring the next ten years, and the character of the operations. This mecheme should be drawn up by the Superintendent of the Foreat, and anmitted to the Epping Forest committee, who might, if they thought well, take further advice as to the proponals made in the trheme.

Our Almanac.- We hall be obliged if secretarie of horticultaral and other nocieties, and our correapondente generally, will send us as soon us possible the dates of any exhibitions or meetings to be held during 1896, for inaertion in our annual Almanac.

Linnean Society. - On the occation of the meeting on Thureday, November 21, Mr. J. G. Bayer, F.R.S., Vice-President, in the chair, his Grace the Dake of Bedford, Mears. Bernard Arnold, and E. B. Fernan were elected Fellows of the Society. Mr. B. B. Wood was admitted. The Rev. G. Henslow exhibited a MS. Commonplace Book of the latter end of the fourteenth centary. The entries in Latin and English were found to consist chiefly of medical recipes, in which about 200 planta are named for their use, and some method of distilling aqua vitse deacribed. In addition were some notel on

The obliteration of the two cell began about the second or third week after the pathe was open. By the end of the eventh week they were reducad to narrow slita, which were still traczo able in the mature fruit. Oa behalf of Mr. A. J. Ewart, Professor Harvey Gibson gave an abstract of a paper on "ansimilatory inhibition, the causen by which it may be induced, and their influence on vitality." It was shown that most inhibitory agencies operate by inhibiting the initial atages in assimilation, bat any cause affecting the rapidity of removal of carbohydrates from assimilatory celle will also affect their power of assimilation, the commencement of which in determined mainly by the development of the chlorophyll pigment, but is also influenced by other indeterminate factorm, probably plasmatic in origin. The paper dealt mainly with the discusion of experiments with a large number of plants, and criticiom of the resulta arrived at by
other inventigator. An intereating discasnion followed, in which Dr. Scott, Professor Reynolde Green, and Professor Weiss took part. On behalf of Mr. A. C. Seward, Profensor Reynolds Green gave the anbutance of a paper on a new apecien of Pinitea from the Wealden (England).

At the evening meeting to be held on Thureday, December 5, 1895, at 8 p.ar., the papers to be read are:-I. Mr. J. C. Droce, F.L.S., "Oa a New Specien of Broma in Britain; II. Mr. W. F. Kirby, F.L.S., "Notea on New or Rare Phasmidæ in the Collection of the British Museum.'
the royal horticultural Society's Com-MITTEEB.-At the last meeting the various committeen were asked to recommend the namen of new membern to replace thone who retire by rotation or otherwise. It is very advisable that new members be introduced, and those who can suggent desirable pernons should at once communicate with the chairmen of the respective committeen. The meetings of the Scientific Committee have been very poorly attended during the last year, and it is obvious that the rale enacted a few years since, though unimpeachable in theory, has, in the case of this committee, proved dieatrons in practice.

NATIONAL ROBE SOCIETY.-The nineteenth annual general meeting of the National Rose Society will be held, by permission of the Horticaltaral Club, at their Rooms, Hotel Windeor, Victoria Street, Weatminater, on Thursday, December 5, at 3.30 p. \(\mathbf{N}_{1}\), to receive the report of the committee, to pass the accounta, to elect the committee and officers for the ensuing year, and for the transaction of other general basinesr. The nineteenth annaal dinner of the National Rose Society will take place, by permimion of the Horticultaral Clab, at their Rooms, Hotel Windsor, on the name day at 530 p.m. The chair will be taken by the Rev. A. Foster-Mrlinar, Vice-Prenident.

Royal Botanic Society.-A meeting of the Fellows of the Rojal Botanic Society was held on Saturday afternoon in the Museam at the Royal Botanic Gardena, Regent's Park, Mr. Artide Rigg presiding. The following new Fellowa were elected Sir Oawald Monley, Lady Milford, Mrr. Miley, Mra. Napier Sturt, Mra. Vignolen, and Measra. D. Banman, H. Hoare, J. Homan, and C. Raleigh, and, an a member, Mrs. Carre Tucker. The eecretary atated that the nociety was in ponsession of one of the finent collections of economic plants in England, and he exhibited three specimens of Cinnamon grown in the gardens, Cinnamonum zeylanicum (Ceylon), Cinnamonum Cania (Eant Indien), and Cinnamonam Kiamis (Japan). The following donations were also on view : Rhizomes of Gloriona superbs (India), presented by Mra. Garden; Tears of "Frankincente" (Olibanam tharifera), prezented by Mr. James Collins, and wome very fine Chrymanthemum blooms and reedling Cyclamen, one year old, grown in Jadoo fibre.

The Palmb at Battergea Park.-This park contaiun a fine collection of Palma, eatimated to be worth \(£ 2,000\), but there is no proper building available for their reception. Many are thrant away from public obnervation in one of the atore greenhoumen, the floor of which has had from time to time to be lowered to give apace for the growing plants. They now atand in a pit nearly 8 feet deep, and as this is below the river level, flooding takes place. Other Palme are ignominiously laid on their sides in a neighbouring greenhouve. In 1891, the County Council renolved to build a proper ehelter for these planta, but this decirion was mubrequently revoked in view of the possibility of the Albert Palace becoming available for the purpore. The Parke Committee is again seeking authority to erect a Palm. house at an entimated cost of \(£ 2,000\).

Mr. H. R. Hutchingon,-The completion of the gigantic Index Kewenois has liberated Mr. Hercinsson from his employment on that worl. Mr. Hurcernsor has been working under Mr. Jackson's supervinion for more than twolve jeare,
and him services as an amanuenain familiar with plant-names and with botanical literature would be of high value to anyone requiring such servicen, as we can tentify from our own knowledge.
"The Rosarian's Year-Book for 1896 " will be published on January 1, 1896. It will be adited by the Rev. H. Honywood D'Ombrain, Hon. Sec. of the National Rone Society, and will contain :1, Mr. Alexander Dick*on (with photograph), by Mr. C. J. Grahame ; 2, The Miniatrations of the Flowern, by Rev. D. Williamson; 3, Rose Growing in California, by Mr.'John L. Howard, of San Francisco ; 4, Single Roses for Garden Decoration, by Mr. George Laing Panl; 5, The Rose and the National Rose Society in 1895, by the Editor; 6, Lord Penzance's Hybrid Sweet Briars-their farther Development, by Mr. Charles Wyatt; 7, The Rose Weather of 1895, by Mr, Edw. Mawley, F.R.M.S., Hon. Sec. of the National Rose Society.

Botanical Ebtablishmentr.-The Kew Bul. letin (Appendix iii., 1895), has a full list of pablic botanical establishments at home and in the Colonies, together with the name of the officern of thone establishments.

Flowers in Season.-We have received from Pentillie Castle, Cornwall, where Mr. T. Johnson it gardener to Colonel A. Coryton, some exceptionally robast flowering ahooth of the lovely and fragrant greenhouse plant Lucalia gratisnima. Uaually, the plant is not eary of cultivation, and wach heads of flower as sent are very rarely seen. In size they reminded us whilat unpacking them, of large-fiowered Hydrangear. From the appearance of the flowers we conclude that the plant has been grown in a border in a cool greenhouse, bat in such a locality it would probably aucceed under the shelter of an outside wall.

\section*{Peeblesehire Horticultural Absociation,} -The fortnightily meeting of the above sunciation was held in the lesuer Good Templar Hall on Tuesday evening, and in the absence of the Vice-Prenident, Mr. A. Slater, the chair wan occapied by Mr. D. L. Mackintose, Kingumeadows. After the meeting was opened, the chairman introduced \(\mathrm{Mr}_{\text {. }}\) Jambs Graham, gardener, Coltnens, who read an inatractive paper on the "Cultivation of Orchard-houne Fruit Trees in Pots." At the close the chairman convejed to Mr. Grafam the thanke of the amaciation for his instractive paper, and also for the fine exhibition of Pears which he bronght to illuatrate him subject.

Mild Weather and Hardy Flowers.-A corretpondent, writing from the went of England, remarks apon the wonderfully mild weatherJamines, China Rosea, Wallfowern, Violets, Pyru japonica, \&cc., are in fall flower,

Presentation.--We underatand that it in the intention of the leading foreman and others in the employ of Menarn, Jas. Veitce \& Sons, Royal Exotic Nurnery, Chelsea, to present an illuminated addrems, a timepiece and two nilver candleaticks to Mr. Davidson, on his retirement from service. Mr. Davipson has occupied the onerous post of manager of the seed department for twentp-neven yearn, and is relinquishing it on account of failing bealth.

Summer \%. Autumn Shows,-At Wcrkep in Nottinghamshire lant sammer the local Rose and Horticultural Society's exhibition was held ander very unfavourable weather conditions, the renult being a heavy deficit, although the thow itaelf was all that could be desired. To enable the committee to meet the loss, it was proposed that an aatamn nhow should be held, without prize competitions, aimply relying apon the aupport of the horticultarista in the neighboarhood. H. V. Machir, Evqe, of Workmop, gave very cordial support to the idea, which resulted in a surprisingly naceensfal exhibition in the town-hall on Nov. 21, when, without a prize of any kind, an admirable display of Caryannthemam plants and fruit was obtained. Collections of
the Dake of Portland, the Right Hon. F. J. Saviu Foljamber, Sir H. Watson, Viscounten Galwaz, Mhe Aldrrson, J. D. Ellers, Esq, Vircount Halimes, and Mra. Mellish, Hodsock Priory. Meara. B. \&, Williams \& Son also contribated a group of phanta, The exhibition was opened by the Dachem of Nm. castug, and resulted in a clear gain of \(£ 50\) ather paying off the deficit. It was an interesting experio ment, bat it is to be hoped the next summer thon will not only be able to meet ite own expennee, but posaibly to provide something towards the entablinh. ment of an annual autamn exhibition. Cor,

\section*{Cheshunt, Wormley and District hortio} cultural Mutual Improvement Secietr.At the anal fortnightly meeting of thin Society, held at Tarnford on Friday latt, Mr. Horcancon presiding. Mr. A. Prabce contribated an interenting paper on the Taberous-rooted Begonia. At the close, a discussion was initiated by Mr. Hercasoon, and taken part in by Mearri. G. Weston, A. Shrose, W. Palmer, and otherre, the subject being chiefly the rust-divease of the leaves of Begonias, peatr-compont, masaren, \&c. Hearty votes of thankn to Mr. Pearca and the chairman concluded the meeting. The next meeting will be held on Thursdy, December 5, when Mr. War. Habrison mill gives lecture on Grape-growing for Market.

Flora of Dumfriesshire." - Mr. G. r. Scott-Elliot, aaniated by J. McAndebw, J, To Johnstone, Mies Hannay, mad othern, han writton a Flora of Damfriesshire, including Nithadale in Kirkendbrightshire. This work is, it is stated, almost entirely produced by local botanitut, who have studied not merely the land and maritime planta growing in the districts named, but aloo the insects frequenting the vegetation, and the conditions of climate and moil under which it occars. Introdactions on the geology, entomology, climate, and meteorology of the neighbourhood, and a map, partly geological, are accordingly included in a volume treating mainly of the local fora. Every where, nowaday, the inter-relations of the various aciences are acknowledged, and also the impor sibility of treating of any one of them without constant reference to kindred atadien.

An Unparalleled Attraction.-In a colthege window in a well-known reaside town, we lately observed a small, but doabtlens select, collection of fruit and nate. That posaible purchasers might on no account fail to notice these dsinties, attention was attracted to them by the following inscription, most legibly written, and poised among some Applet: "Look. Namber ellh, \(1 d_{0}\) a pint." Though quality of the frait might be easily equalled or excelled by that of other samples of it, the libed aurely was, at least, as regards apelling, a nonpareil

Tree Plantina in Aberdeenshiae.-The Land Committee of the Governors of Gordoril College, Aberdeen, a college posseswed of many gerem of land, have accepted the offer of Menarn, Wirulis Smith \& Sons, nurserymen, Aberdeen, for planting the land of Pitdoulzie, Auchterleas, with trees, their ostimate being at the rate of \(£ 116\) s. per imperid acre, and \(8 \%\), per acre for renewal for two jurn. Mr. Thomar Milne, Glenburnie, was the neceme fal offerer for farnishing the plantatione a Cogierieve and East Craig, his entimate being at the rate of \(£ 2\) per imperial acre. He alvo thiple ates to renew at least 1000 trees within tro yall if required.

Thee Plantina at exmouth.-The fint Lime-tree of the many which are to grace nwold the principal atreetm in Exmonth, was prat to recently in most beantiful westher by Mr. Ru. Lutr, chairman of the Diatrict Council. Some ount pressure was brought to bear, and a privste tres mittee offered to parchase several hundred of the if the Council would accept and plant themer preve ef? they have undertaken to do, and in the preveran furs an enormous crowd, amcong whom were tome appro-
priate achool-monga, the initial atep was taken. The chairman in the course of his remarka alid that it was a great pleasure to him to have planted the first tree, and hoped the avenue of which it would form a part would become a source of pleanure to the inhabitants.

Iribh Gardeners' Absociation.-Mr. J. H. Parakle, M.P., lately delivered before this Society an exhaustive lectare on Fruit Calture in the Southern Staten of North America, in the courne of which he deacribed the Iriah as a quarter of a century behindhand in fruit-growing, being in about the asme condition an were the inhabitants of the State of Alabama when the lecturer first attled there. Now fruit-growing wae one of the mont important industries of that State. If Irish fruit-growers meant to make their induatry a commercial auccess, they muat first of all find out by experiment what were the varietien of frait and vegetables best adapted to the local condition. When he firat began to send fruit to New York, one car-load a day wae conaidered aufficient-indeed, almont to glat the market; now they were sending 100 car-loads a day. It took a long time to ascertain what each tract of country was apecially adapted for, but perseverance and experiment had done it for them, and similar atep would have to be taken in Ireland with a view to finding out what fruite did best in different parts of that country before the industry could be established on a cound commercial basin. The fall account of Mr. Parnell's lecture is given in the Irish Farmers' Gazette of November 2. Mr. F. W. Moore, of Giaenevin, made some pertinent observation: on the eubject (f fruit-growing in Ireland, pointing out that finer Apples were not to be seen than those produced in Ireland.

Thee Planting in the ible of Man.-We learn that on the crown lands in the Isle of Man Her Majenty's Comminsioners of Woods and Forents continue afforeatation operations, and we underatand Mensrr. Thos, Kennedy \& Co., Damfrien, have again secured ordera to supply a large number of foreat trees for this parpone.

Horticultural Meetina at Ghent.-The fineat exbibit as this meeting was cer tainly that sent by M. Lucien linden, consisting of eight plendid varieties of Catasetum, of which five received a Certificate of Merit (par acclamation); they were C. mirabile, macrocarpum, Lindeni, slendens, chryotoxam, Bangerothi cupuliforme, and macrocarpam aureum, already described and figured in the Gardeners' Chronicle. M. L. Linden sent a Davallia Truffautiana, which also obtained a Certificate of Merit (par acclamation), and which is also knuwn to our readers. M. G. De Saighbr obtained a nimilar award for fifteen beautifully grown Chryanthemoms, all good sorts. An equal award was allotted for Hypolytrum Schraderianum, from M. Pynakrt, a very ornamental plant, reambling a gracefal Pandanus; the leave at the bave are of a beautiful violet-rose tint (ee Gardeners \({ }^{\text {a }}\) Chronicle, April 8, 1893, p. 414). Certificates of Merit were amarded an follow:-To M. F. Dessois, for Poinsettia palcherrima fol. aureo var., the leavea nicely bordered with golden-yellow, giving a very pretty effect when the plant blooms. To the ame exhibitor, for Scolopendrinm vulgare acalariforme, a very curious variety, crimped, embonsed, and andulated; to M. Pymakrt, for Asplenium marginatum, the foliage very pale green, almost transparent, remarkable above all for a thickened membrane of darker colour which borders each leaf, and also to M. Pymagrt for Pberis eerrulata voluta, a aeedling Variety with wavy foliage and pale in colour. To M. Rodias, for Peanivetam Rappelianum, a most elegant grass; the light spikes are violet-rowe in colour, and will be useful for floral decoration. To M. Julas Hre, for Lerlio-Cattleya Diana, L. elegana \(\times\) C. pamila; the lip, which is dark purplish-red, it a great advance. To M. Lo De Smet-Duvivirb, for Cypripediam bellatulum and C. Charle worthi, two Harietien of each pecies. To M. Arthur Van den Hesin, for Pteris Buchneri, a variety of atrong and robuat habit; usefal for cultivation on a large acale.

To MM, Dec Mryer and L. De Smet-Dutivire, for Asparagus Sprengeri, a greenhoune variety of vigorous growth, and producing, if jut theltered from frontw, a quantity of elegant bright green spiker, very decorative.

\section*{Chrysanthemumb at Antwerp.-The recent} exhibition organised by the Société Royale d'Horticultare of Antwerp, hows the progrens made in Chryananthemum caltare, as both amateur growers and horticulturiate alike ataged new and well-cultivated plants. Among the exhibit were the following from M. Tr. Vermedlen: Iaternationale, with thirty flowers; Mdlle. M. A. de Galbert, Dac de York, M. E. G. Davernay, M. Charlen Molin, M. E. Boyce, M. Ad. Giraud, Benjamin Girand, and other varieties, attaining a maximum height of \(4 \frac{1}{3}\) feet, and each bearing from twenty-five to forty flowern. M. Henar Vanderlinden ataged Lincoln, 4 feet high by 41 feet across, with 200 flowers; Internationale, with fifty-four flowert, nearly 8 inche acrons; Souvenir de Jambon, with ninety-two blooms, and nearly 5 feet acrom, and other varieties. Among the plants a year old should be mentioned Suneet, with fifteen large flowern; Docteur Allard, with fifty bloom: Waban, a marvel, with flower nearly 10 inchen acrons; M. Benjamin Girond, with fifty bloom: Charle Davis, with twenty-five large flowers; and L'Etendard, with flowers nearly 8 inches acrons. Among M. Calvat's new varieties were an un-named sort, clear aulphur-yellow, very delicate Secretaire Général Ein, Fiereav, dull red, spotted with yellow; Rêve d'Or, pale, shining golden-yellow; and Madame K, Rey-Jourin, lilacy-rone. Co De B.

Exhibition of Flower Paintinge-An interenting exhibition of flower-paintinge in watercoloura has just been opened at 293 (over Equire's), Oxford Street, by Mies Marir Low, F.R.H.S., who is already well known as a clever floral artist. For nome years Miss Low has made a specialty of flower painting, and anyone who sees her work at this exhibition will be convinced of its excellence. Among the many examples of her art may be mentioned a glorious picture of a mans of Lord Penzance's Sweet Briart, which have excited no much attention during the last jear or two. Papaver orientale, with it huge carlet blooms, make a splendid picture; so also do Disa grandifiora and a group of Dr. Wallace's Calochorti. Among many other flowers represented may be mentioned Mr, A. J. Rowberry's new yellow Pansy, the Uriah Pike Carnation, Aaemone japonica, Mimular, Daffodils, Clematis, and several Orchids. The charm of Mins Low's water-colour painting lien in the softnest and brilliancy of the coloare, and the fact that she can pourtray objects in a very natural way.

New Publications.-Introduction to the Study of Fungi, by M. C. Coore, M.A., LL.D. (London: Adam \& Charles Black.) - Oher Edible Toadstools and Mushrooms, by W. Hamilton Gibson, with thirty coloured platen. (New Yotk: Harper Brothers.)

\section*{whiteley's nurseries, HILLINGDON.}

In the rapid and perfect manner which characterise Mr. Whiteley's business operations, another portion of the nursery, to the extent of \(2 \frac{1}{2}\) acres, has been put under glass, and is now occapied by a fine roomy block of housen, each 240 feet long and 24 feet wide, and by a run of commodious lean-to houses under the boundary wall. When atarted, the old block was thought to be ample, but it was not found sufficiently extensive, hence the prevent great addition, and the contemplation of covering more gronnd next year.
The block of housen, built with a view to every possible need in the cultare of the plants, by Mr. W. Duacan Tacker, of Tottenham, requires more than passing attention, for in it are aeveral new ideas in the arrangement, and in the ventilation and water-supply, most of them worked out at the suggention of Mr. G. Bethell, the ciever and
well-known manager at Whitelej's Nureeries. For exsmple, every part of the wood-wort of the interior is either grooved or throsted, so that drip is Imposible, and the throating of the heavy pitch-pine timber which forms the wall-plate of each pair of houses, as well as the water-way between them, will give a much longer life to the atructure by preventing decay in that vulnerable part. The bottom ventilation too, which is arranged by glazed drain-pipes bringing air from each end, and allowing it to pase into the house at intervals through openings carefully regalated, is another good feature. The pipes are mado to anower a double purpoee, viz., to briag in freth air, and to carry off the water from the roof. Continuou lever-gearing effects the oshes ventilatiog appliance of the houses. The arrangements for water-supply at all pointe, and for pasaing plazts from one house to another, and other labour-asving contrivances, are admirably and economically carried out.

With regard to the heating, the new block enjoy exceptional natural advantages, for the ground gradually rise from the end, where the two ets of three 10 -feet Cornish boilers are placed to the extreme end, and thus a proper flow and return are facilitated. So preaning is the demand for space, and for the atock to be got out of it, that all through Mr. Bethell hat been treading on the heeln of the builder, and even now the greater portion of the block is filled - and well filled too. Some four of the great roomy tructures contain thouenade of beautiful Palme, among which the gracefal Kentias of courme predominate, though Latanias, Seaforthia, and Coryphas are repremented in auch proportion at the Enoaledge of the demand at the great esablishment in Weatbourne Grove show: well how to regulate. Kentias are the favorrite everywhere, and in boxes fast requiring poting-off, Mr. Bethell hes something like a million coming on resdy to take the place of those now aleable.

About 14,000 aplendidly-grown Chryeanthemuma occupy several of the other large houses, and present a bewildering mans of colour in them from end to end. Only the bent sorts for market, and for cutting, are grown in quantity. Though every new one is tried, few ancceed in getting on the list of thon to grow largely. One of the bent ever tried is W. H. Lincoln, and of this Mr. Bethell has thousande, both tall and dwarf, the large plants having from eight to twenty immense rich yellow flowers; while those not more than a foot high, in 48 -pota, bear aix to ten. It hat atrong wood, fine lasting foliage, and noble flowers, which lat long, either cat or on the plant, and these qualitien constitute a fine market variety. Two aports obtained at Hillingdon are being worked up, and bid fair, viz, a bright yellow Charlen Davir, and a fine white Mdlle. Lacroix. Eynenford White, too, is a great favourite.

Azaleas, Tuberones in all stagen, Bouvardian, Genistas, and all kinds of bulbs for forcing, occapy the remainder of the houser, many of which in their season will be filled with Tomator, a commodity with which the conamer never meem to get satinfied.
In the old block, with it lofty covered arcade 300 feet long, for packing and other operations, wome twenty-six houses are devoted to Ferns, and yet so rapid is the ale of plants in mall potn that there is often a difficulty in gotting enough for potting-on. One houwe is full of all pure white Cyclamens, not one of the plante haviog a trace of colour; eeveral with Aralia Sieboldii, some with Crotons as brilliant in their coloured foliage at are the flowering platata in their blooms. In one are cores of plant of the graceful and handeome Dendrobinm Phalæaopeia Schroderianum, their fine sprayi arching all aroand, and in no part of the vast eatablishment is aninch of room wasted.

This portion is thu decribed by the buildert, Memrn. Messenger \& Co, of Loughborough:
"The west wall (to right of illustration, fig. 108) is 14 ft . high, and upon this are built the lean-to vineries, in all 650 ft . in length, and 14 ft . wide. They are divided into two block, dinconnected in the centre; but the bouses are practically eeven in number, thus divided for early, intermediato, and

Late varieties of Grapes. The wall in the foreground is ocoupied by Peach-houses (lean-to) in three divisions: total length 268 feet. The further or south wall provides accommodation for the Mowhroom-house, 180 feet long.

The main block of baildings consists of thirty-three houses, chiefly equal spans, arranged in three sections, with intervening roads. The section on the south side comprises Chrysanthemume-house (in centre), 18 feet wide; Pine-house, 13 feet wide ; and others for Orchids, Melons, stove, and other plants, each 12 feet wide. The length'of each house is 117 feet, with divisions as required for growing purposea.

The contral block comprises Camellia-house, 18 feet wide : Pine-house, 15 feet wide; Orchid-houses, Cucumber-houses, toves, and plant-houses, each 18 feet wide. These are also 117 feet in length, with divisions.

The remaining block comprises houses of various lengths, he longest being the five to the west side, which are 266 feet in length, and are built without front lights for use as stoves. These are 15 feet wide. Next comes a commodious structure or Poses, Camellis, and Chrysanthemums, 231 feet long 18 foet wide. A three-quarter apan for Strawberries, and our span plant-houses, each 218 feet by 14 fest, complete this group.

The span and lean-to pits are a feature of
he total length of them is close apon 1,450 feet.
To obtain an efficient water supply, capacions tanks puin rosswise through the centre of each group of houses. Into these the rainwater is carried, the collecting surface of course being considerable. Psovision is also made in each house for obtaining the water from the tanks.

The heating is derived from nine Trentham boilers arranged in five stokeries at convenient intervals. These can be used eparately or together as desired. There is also an ample mount of piping to each house.'

\section*{ABOUT CHRYSANTHEMUMS.}

At the Home of Flowers, Swanler,-Ia the very large house which Mears. Cannell \& Sons groap their Chryanthemam plants each antumn, it is possible to make a very imposing display, ita capacity being practically equal to the accommodation of the whole of the stock, which is itself exceedingly large and varied. Of coarae, there is no room to spare, and it has become requinite here, as in other places, to aelect with great discrimination the varieties to be grown, for the objget of farnishing blooms that may be exhibited at the varions shows, where Mesars. Cannell take their wonderfal Pelargoniume, Cannas, and other things. Space has to be found for the increasingly large number of home seedlings, and for the tenting of Continental, American, and other noveltien. In addition to these, only the very beat and newest varieties are included, and the greater part of the stock is planted out and grown quite differently for the production of healthy catting for stock parposer.
Examining the seedlings first, we were impressed by the unusually d warf character of the plantr. Mr. Cannell ham been working for some years to procure a race with lower stature then we have become used to, and to a large extent he has sacceeded, but one is prepared to find that a large-ilowering tendency, an well as varied colours, are not easily obtained for the first few years that these efforta are made. However, when good flower: are borne by seedling not more than 2 feet higb, it may be hoped that auch varietien, thould they be worthy of a place in reapect to the quality of the flower, will at least prove less in heightanother seavon than thowe that ased to run ap to the roof of a vinery at its centre. Eureka is a name given to mach a meedling. It is a white lowering Japanewe, a wide flower with broad floreto which benide alightly incarving, have alvo a kind of twist in the direction of a ring. Mrs. Oporto Tait on the seedling plant, is alno very dwarf; the flower a yellow Japanese, florete broad and slightly wisted, colonr very pleasing, Lord of Lorne in a deep gold coloar, similar to Thunberg, and Mr. Cannell thinks it may be superior to that fiue variety. Wood's Pet is a seedling from Sanflower, and is rone-coloured, the floreta droop in ringleta, and it is hoped the variety may prove a good one. Other nedlinge, many of which are as yet unnamed, were noticed in considerable quantity. New varietien by other rainers were noticed, but most of thene we have referred to on former occavions. Kentish White looked well, and was present in quantity. It was awarded a Certificate by the National Society a week or so again, and though the bloom an generally exhi bited is of modorate size only, it is very pretty, and
the habit of the plant is dwarf and good. Dacorative varieties, uch as Mr. Cannell's Centaurea, Mra Filkins, and othern, with narrow, twisted, and otherwise bizarre-appearing florets, are popular with many persons, and are no donbt very adaptable to nome kinds of decoration.

As raual, there was to be seen on this occasion an excellent diaplay of zonal Pelargoniams in fall flower, and Cannas, and other plante, intaresting and cheerfal-looking. Mumo

\section*{Chrysanthemoms, etc, at the Grange}

For several years past Mr. A. H. Smee, of the Grange, has made a practice of throwing open his gardens to his neighbours and the public generally in the autumn that they may see the Chryanthemume, and in the apring that they may have an opportunity of inspecting the orchards for which he is famons. In accordance with this castom, the garden have been once more thrown open to visitorn. The Chrysanthemums were arranged in the large greenhoute, between 400 and 500 plants being exhibited. Thir year they have been grown mach more dwarf than hitherto, und consequently the visitor on entering the house found facing him a bed of bloom rising from between 2 and 3 feet high to over 6 feet. Perhapa the most notable were Commandant Blassett, Bsanty of Exmouth, Florence Davip, President Borel, W. Seward, Mrs. Harman Payne, Mdlle. Thé èse Rey, Lord Brooke, Autumn Tints, Niveam, Dake of Yors, Gloriosum, and Madsme Cambon, which was grown from set dling raised in Algiers. Amongst the singles were Miss Rose and Mary Andorson. All the plant are strong and well grown, showing that the greateat care and cultural akill have been bestowed apon them, while the blooms are large, well-shaped, and in the fineat ponsible condition. In addition to the Chryanthemum-houne, visitort were permitted to inepect the Fern-house, which rever looked better. The Cattleya-house contained some very fine specimens of Cattleys in bloom, some Oncidiums, Cypripediams, and Dindrobiums. Wallinzton and Carshalton Herald.

\section*{WARTER PRIORY, POCKLINGTON, YORKSHIRE.}

This, the residence of C. H. Wilson, Esq., M P., is delightfally situated in beautifully andalating, welltimbered grounds, near the village of Warter. The Priory was formerly the site of a religious house, but nothing remaine but the name. Tae com nodiona modern manaion is replete with present-day conveniences of all kinds. The gardens are tastefolly laid out with flower bed, lawns, and ahrabberies, and everything about them is in perfectly good order, at befis a place of which the owner is proad. The flower-garden this year had at the time of my visit suffered asverely from a thunderatorm, and the wellfilled beds of Pelargoniums were bereft of mach of their blonoma, and all the others had temporarily suffered with the exception of two large beds of tuberous-rooted Begonia, which were, in spite of it all, a blazs of coloar. Other fine-looking bede consisted of Pelargonium Went Brighton Gem, a variety that withatand rough weather batter than som otherw ; and Mrs. Clibran Nastartium, a good thing for bedding. Soveral species of Bambusa and Palma of large sizy are among the plants effectively made use of in groups together, and as single specimens.
A plant-coneervatory adjoins the residence, and here were found Palms, Dracenas, climbing plants, \&cc., and even in the fall summer, it is kept well furnished with plants in flower. The large range of plant and fruit-houses well repaid the vinit. The Orchid-houves numbered three, and these were filled with many valuable apecies and varieties. There are two plant-stoves, two Rowe-houren, a Gardenia-house, fernery, Palm-houne, greenhouse, two houses for the cultivation of Eacharis, and four for that of Carnations ; the varieties of the latter consisting of Souvenir de la Malmaison, Winter Cheer, Uriah Pike, and others. Rarely have I observed the firatnamed in finer health and condition. The fruit-
houser consist of two large apan-roofed vinerien with Vines carrying heavy crops of good Graper, the sarietie consisting of Muscat of Alezandria, Grou Colmar, Lady Downem, and Black Alicante. Some mall lean-to's supply Early Grapan, Peachen, and Nectarinem. The Peach-housen contain splendid treen of the best varieties. Among other howem observed, mention shoald be made of one for grove. ing Pearn, Melon and Cacamber-hoanes, and tome orchard-houses. Mach work was in progrem, and alterations and improvements of variona kind andertaken. The Chryanthemum is a plant the it largely grown for decorative purposes, and the gur dener, Mr. Pike, is an exhibitor of tham; the collection contained a great number of the bert modern varietien. \(B . W\).

\section*{Home Correspondenoe.}

ENGLIBH vzrsus GERMAN CYCLAMENE.-At the grower of Cyclamens for one of the firma best known in England for their strain of Cyclamena, and roo cultivate upwards of 20,000 seedlings and old bulbe or corms every year, I think, altor reading tho article, "English v. Gierman Cyclamena," that the Eoglish varieties could not have had fall jatice during the growing period, or they certailly would not have appeared so inferior in quality as pointed cut. I myself think it would bo a very difficalt undertaking to surpam the Eoglish varieties that were grown by Mr. Schwarzburg, if they had the right treatment, mati of which were raised by the firm I am with, and car. tificated by the same at different period. I deo noted that there was a complaint about purity of colour. Nor is a pare white mentioned in the liv of Eaglish names. If they had, the following fors named varietier, Mont Blanc, Dame Blanclete Baroness Bardett Coatts, or gradiliora albe think they would have compared very favourblif with the German atrain, as all four are aplendid whites if grown to their beat. The marking of the foliage is not given mach attention in Eagland, the poins aimed at being a good sturdy plant, with quantity of flowers and quality combined to mato is sell. But if our friend over the water molid like to aee English-grown apecimens in their glory they could not do better than take a trip acrom in March and attend the Crystal Palace and Rageat Park spring ahown, and I think thes would highly atiofled that Cyc'anens can be well done in Eigland. J. N. S. [Why should not our Berine friends and some of their choicent anmplat iof comparison? Ed]
that climbing french bean. - Riferriog to the correspondence on this subject, may I ak kitay body ever anwa French Bean that did not clieb more or less, where it had the chance? or if werect any gardeners who would have a climbing Froed Bjan needing sticks to support it, when they couls have the ame Bean equally good without that exhat and uneless trouble? French Beans will cim allowed, and Scarlet Rannert, if pinched, do equally well without climbing, and are axtent sively grown that way by market-men. I andertan from what I have seen, and from read in the Gardeners' Assiotant, \&e., the French growers have French Bonse Runners) that climb from 6 to 9 , If路 seem absard to have one grower
a Pea because it does not need sticking, and puffing up a Bean for the opposite resano ; and \({ }^{\text {B }}\) would be very interesting to learn if "A. D." anyone else belonging to the Royal Horticic Society's Committees ever seriouly propou bestow an award on a Bean whose sole recomman tion was that it needed sticks to sapport Mr. Ward pats it, becanse it attsined "s " heardoof height of 7 feet! claim wee nev. A large portion of the cali climbing Pea and Bean culture is the stichis diapose of thousands of Pea and Bean rodr from the woods, at from \(18.3 d_{0}\) and \(2 s\) and per 100, according to quantity, rather fancy notions about their Scarle rown. That is the cost of sortiag ask wood, and by the time they are carried add ? to the crops and removed again in In large part of che profit, if any, is gone
of crop of Scarlet Ranners which, daring the past mumer, did not pay for the sticke and sticking, at from 1d. to \(2 d\). per 1b. I have seen from twenty to thirty long rowe of tall Peas and Ranoers, in gardens, that must have cost nearly 20 s. per row to sticktram that would have sapplied the Pess. J. S. W. [Oar usual 'cate correspondent seems to have missed the point in this case; for it is not becanse it is a climbing variety that it has found, and is likely to find, farour with gardeners; but because it is a mach more continuous bearer, and in that way tave land, aeed, and labour. With French Beans of the ordinary type, we muat sow ouce in three week from the middle or end of April till the middle of Jaly, if a good succession of tender pod is to be obtsined; whilat with this new Basn twice or thrice would saffice. It is a moot question if this Ranner Kidney Bean would not be profitable as a forcer. The chief danger to be apprehended would be, of course, the entire lons of the leaven from red-spider. We can insert no farther correspondenca on this nabject. ED.]

ROBA RUGOBA FOR GAME COVERT.-Daring the past two wintera we have planted mall patche

APPLE8: THE TRUTH ABOUT PRICEB-RIBSTON AND COX's ORANGE PIPPIN.-I heartily thank the ensayiat for hin obliging reply to my inquiry an to the low-placed price occapied by these two fiaest of our deasert Apples. I had the most perfect faith in his quotations, and had a arewd suspicion-confirmed by his lacid explanation-that it is bat another case of ize, colour, bulk, over-riding quality. It must be borne in mind that the essayiat is here writing of marketing and making wolid profit out of Apples, and mont growers will readily allow that Yeasgood's Nonsach at \(28 s\). per cwt . will fetch more m nay per acre than Cox's Orange Pippin at 308. percwt. The more's the pity! But then pity will be a long time in moulding pablic taste or controlling prices by quality alone; though ponibly as raw Apples get to bo more eaten food, ach plendid norte as the Ribeton or Cox's Orange Pippin will command auch high prices an to render them the most profitable market Apples. Meanwhile, however, it is very discouraging to hear on ach high authority as that of this able essayist, that he has never yet been able to make a profit on his Ribatona, either on the Paradise or free atocks. I had hoped that the Paradise stock root-pruning improved culture and training would
price that Peagood's Nonnuch and Warner's King, we thould no longer have our market growers and writers asuring us that they could no longer grow our beat densert Apples at a proft. I hope no one will aname that the Applen named are necesamily on all sites and soils the beat of their clan for eating or cooking. In any attempt to get prices controlled by quality, I thought it wise not to bave the issue confused through comparison of the merit of contending varieties. D.T. \(F_{\text {. }}\)

THE JUDCING OF VEGETABLE8 AT \&HOW8.We seem sadly to want a national code of rules for jadging. Might not some pablic body such as the Rayal Horticultural Society, for example, compile uch a code? It mhould take each vegetable in the order of ite utility, and atate the number of marks to be given it, allowing for quality, cleanlizess, staging, \&c. It such a atandard were formed it woald be of the greateat eervice to jadget, particularly as in a case I have in my mind, where the judge was a traveller and not a practical man. I wall be greatly plesaed to hear that such a code is available, and that I have overlooked it. W. H. Patterson.

Vale of Cleveland and bharpe's victor pOTATO8.- For nome years we have grown Vale of Cleveland Potato, and we have no hesitation in pronouncing it to be identical in every reapect with the yellow-fleshed Sharpe's Victor, and this opinion has been confirmed from time to time by Potato expert who have seen the two varieties growing side by side in our trial gronnds. We procured Vale of Cleveland direct from Mr. Sbort, of the Seed Stores, Market Place, Stokesley, and the informed us that her late huaband sold the whole stock, excepting a few mall tubers, to Mesirs. Chas, Sharpe \& Co., of Sleaford, and that he claimed that Sharpe's Victor, when it appeared, was in every reapect similar to his own Potato. Admitting this to be so, it is quite evident that to the late Mr. Geo. Short belonga the honour of having first raised thi distinct type of Potato, which pomestes all the good qualities of the variety now wo well lnown in commerce a Sharpe's Victor. It in a singular coincidence that two bybridieer thould have raised seedlinge the characterintic of which are identical bat from entirely different parents, and it is somewhat remarkable that Meners. Chas. Sharpe \& Co. whould have become the fortunate possensore of them both; for there can be no doubt that amongut the very earlient varieties of Potatos, Vale of Cleveland and Sbarpe's Victor probably have no rival. W. W. Johmon \& Son, Boston.

With reference to Mr. D. T. Fith's letter in your colomns recently, allow we to ay that the confasion referred to appears to arise owing to the variety of the Potato introfaced and atill known in the name of Albert Victor, which ban a white fleth, being confused with Victor, better known an Sharpa' Victor, which has a jellow fleah. Cultivator.

PEACHES AND NECTARINE8.-I can fully endone the mound and opportune remarka made by Mr. Markham under the above heading in the Gardeners' Chronicle for September 28, F. 370. Peach and Nectarine treen are easily enough grown in 90 per cent, of the garden in Great Britain and Ireland, Where the necessary wall or fence pace is available for training the trees to, alwaye asuming that the caltivator has a practical knowledge of the requirement of the trees, and that healthy kindly-growiag treen, true to name, are obtained and duly planted in good-sized well-drained holes, using sound fertile loam as a rooting mediam. The observance of the above aimple bat most important pointa is aboolutely necessary to attain to success not only in the calture of the Peach and Nectarine, but almo in that of Plami, Peart, Applew, de. All that in required after the trees have been selocted and planted in the manner indicated is to keep them porfectly clean and the ail sbout the root uniformly moint. The growthe thould be trained thinly rather than otherwise over the apace allotted to each individaal tree, diabadding freely at ahort intervale, as advised in Mr. Markbam' oxcelleat note, after the wall apace has been furnished, which, atarting with maiden trees, may be accomplished within few years from the time of planting by following the extenvion yatem of training. Tais connista in not cutting bact the young growth to within few inche of their basen, as uad to be the pracica, and is atill done in many placet, at praning-time the firat year after planting-that is, in twelve or foarteen months from that time. This in how it in done. In the ordinary way, the trees are planted as noon at they
have been received from the nurrery, fteer the fall of the leaf-say, towarde the end of November. The
young shoot, whether two, three, five, or seven, young shoot, whether two, three, five, or seven, are secured loonely to the wail to admit of the
freath soil setting down a little, as well as retarding the flowering period. Early the following Febraary, as soon as the arp beginu to rise, bend the unpraned shootu toward the ground, and secure them to the wall with nails and shreds in that poition, the bend starting from the point whence the firtot of the young thoote is desired to proceed - \(A\) ay, 4 or 5 inches from the bottom of the individaul shoots. The check thas given to the flow of anp caunes a sufficient number of wood-buds to parh from each ahoot to form a good-aized "fan- alapped" tree the frat year after planting. Of courae, as soon as
the bade nearest the base of the individual shoota mo treated have puashed into growth, the naile should be drawn, the shoots-main shoots-apread out on the wall, in the form of a hand with distended fingers, and necared thereto with nails and shreds, learing aufficient room in the later for the develop. ment of the branch, the young shoots indicated above being trained at proper dittances over the intervening apaces. Treer of Crimaon Galande and Dgmond Peach, and Dryden and Humboldt Nectarine, planted a few yeara ago and treated in the manaer described above, have completely farnished the trellis fixed to one of our highest ( 12 feet) walle out-of-doors, and planted at the usual diatance from one another, ripened this year twelve to forteen dozen good-sized fraits on each, which were the admiration of all who saw them. I merely mention this to show those readers of the Gardeners' Chronicle wrong view of Peach culture out-of-doorn, what good returns may be essily secured from Peach and Nectarine trees in two or three yeara from the time of planting by following the extension aystem, which I have more than once advocated in the Gardeners' Chronicle. The crop, taksing thirteen dozan fraits as the average for each of the four trees, and at the moderate price of \(4 s\), per dozen, would be f10 8e, not by any means a poor return for the inatial outlay, space of wall ocecupied, and labour incurred in training, 8ce. That the Peach and Nectarine will grow and flourish planted agninat walls having south, west, and east aspects I have the most conclusive evidence, the only difference being in the time of ripening; the same variety planted in all the aspects indicated wonld yield a pretty good anceession of ripe frait, those ripened on the east and west walls possibly might not bs quite oo good in Alavour as the fruit ripened against \& wall having a soath aspect. Like Mr. Mark ham, I have formed a high opinion of the Early Rivera Nectarine. It is agood grower, and apparently a free bearer, the fruit being unusually large, of handoome appearance, fine quality, and very early in ripening. Inconclucion, I may ay that the present is a good time for traapplanting young trees which have been grown for a year or tmo in available apacesbetween those permanent trees which have not quite furnished their allotted space; liftiong them with good balle, they experience little, if any, check in being tranaplanted into their permanent positions, and time is afforded for the roote to push into the new soil before the trees shed their leaves. Trees so planted gain time, and have decided advantage over trees planted after the fall of the leaf. H. W. Ward, Longford Castle.
TIMBER \(v\). aAME. -1 am rather puzzled by Mr . Foote's dititinctions, p. 582, between practical and technical knowledge, and to learn that employere io not want the lateer. I thought technology consitted of the application of entablithed principles in the arto and crafte, and conotitated intelligent practice as opposed to "rule of thumb;" and I mate say I never met with an emploger who would not have preferred a technically-trained forester or gardener to one of the mimanamed "practical" type. As to woods and game, they can be anceessfally combined, exeept in the case of rabbita in young plantations. It ia quite easy to plant a mixture, or pare forest of good timber trees, for a crop, that will shelter game, provided the thinaing is not over-done. Pheasants want mont protection. They will not atay in winter in \& wood which the wind blowat too freely through, bat a forest of bare poles will break and mobdure the atiffote gale that ever blew if
they atand thick eno they ytand thick enough on the ground. Everyone knowe this who hat atood on the leo-idide of a Lerce plantation in winter, thick, but one which you can tee
through The that atakes or trees break the wind in the same way that tataket or stones driven in, not fat amander, will
break up the motforioue torrent into

I have jaut been making a trout-atair on this principle to enable the fish to climb a kind of caccade. Emplogers rarely object to follow intelligent advice from their foresters whom they expect to undertand their buyinest, as a matter of course. What is most needed among owners of estates is a better aystem of managing their game in conjunction with their woodn. We want more pheasants for the gan and fewer rabbits. Keepera never have a sufficient number of pheasants, and if a rabbit or two is not frequently popping ap between the pheasantes, sport tlaga; hence keepers will not kill rabbits unlets forced by some one who can tep in and take the daty of their hands, and that does the business. Then your keaper will act; if a woodman with a gun, dog, and ferrets has the mere authority to step in when and where he choose, if the frepers
fail. This jaut works a miracle on our friend in velveteen. There are no objections to pheaanats, but the aystem of hatching is deplorable. Given a fair covert with a sufficient atock of cocks and hens to begin with, I would undertake with woll-regalated ahooting, to crowd any wood or antate with wild birde permanently in oae year. Bat what is done? All the early eggs are picked up in large numbers, perhaps every season, and as many more bought to put under hens ; and at the shooting season about one or two birds may be to every dozen egge bought all to the gun, and often not so many, so great is the mortality. I know of the record on a number of eatatas, and this statement is no exaggeration. Rabbits have to be preserved to make up for the pheasants, and the woods have to be kept quite for theene, and the woodmen baniohed for the greater part of the year in order not to distarb the game. If gentlemen would put down atock for wild-nesting in the firat inotance, and simply let their keepera know that game would be expected, and the woods looked after at the ame time, they could, by nome proper arrangement of the work, then have plenty of aport, and also timber. My advice to foresters who cannot secure something like the above conditions is to do their duty as far as circumstances permit, and to view the damage done by the game with philosophic equanimity, always taking good care to let the damage be easily neen by thone who have to pay for it, and to have the said regularly estimated and sent in to the game department. A correct debtor and creditor account againat the keeper in one of the best methods I know of for keeping the sabject warm," for the proceass is one "velveteen" cannot stand, but it bas opened the eyes of some employern. All game-keepers, I contend, should bs under the control of the foreater. S., The Woods.

PACKING COMPETITION AT CRY\&TAL PALACE sHOW. - I was much interested in this packing competition, and I quite endores whas Mr. Harria says respecting the judging being intrasted to Covent Garden salemen-one would be enough. I did not attend at the Palace thin year, but what I saw in 1894 convinced me that a alemman would be the bent judge, and I expresed this opinion as the time. I do not refer to the Grapes, but to the Puaches and Pears, which were nearly hidden from view by the man of material used, and which 1 considered was quite unnecesary, whether they were intended for market or private use; and an one of the jadgen, p. 555, nayw, he and his colleagus found but slight drance over latityear, I may conclude that what I anw lant year wat mimply repeated. In the month of Auguat last, I was in Covent Garden market, and at the atall of one of the leading salesmen I was looking at the Peaches offered for aale, packed in a mane of cotton-wadding, wome over-ripe, and the wadding clinging to the bruied parts; and I said to the malemsn's foreman, "You cannot sell stuff like this." Him reply was, half the fruit sent into the market is spoiled by bad packing. Cotton-wool is not now used by growers to pack Peaches for market, neither is moss, and no aleaman would look with admiring eyes upon any exhibit which was packed in either of those materials. Wood-shavingare recommended by some, and they are cortainly very elatic, in fact, too much so, and there is an odour on opening a box of frnit packed with them that is not at all appativiog; 10 growern use for packing Peaches, finely cat white tiasue paper, which can be bought for \(£ 1178\). Gd: per cwt., and 4 oxs. Fill back box of twenty-four Paachen, costing a little over 1 d . To prove thin, I have this year grown and packed 15,000 Peachem and Nectarinew, and used 14 cwt. of paper having in packing. Our modus operandi is to aske a handful of well-teased thavings over the bottom of the box, take the fruit in the left hand, and with the right
sufficient to keep it clear of the box; when placed firmly in it repeat the procerm until the box in fall, taking care to keep them premed tightly together a the packing progresses. When fall, place s shest of tissue paper the size of the box over all, now shek enough well-teased ahavings on the paper so that when the lid is put on the shavinge are slightly premed upea the fruit; should the box be too deep, ase clean well dried moss or grass, filling up the space firmly before haking on the shavings, and so high that the froite when packed, are nearly level with the top of the box, only requiring a few shavinge to keep them in
position. By thi method of packing, nealy position. By thi method of packing, nearly ono
half of the fruit is displayed, so that buyen cas mo the aize, colour, and condition without touching it The boxes are tied threes or twos together, and wat bp van 5 miles to the railway station, orer rowls and under conditions that would make a narrou to Manchester, i.e, about 150 miles, and not one complaint has reached ut this year. Single boze are more liable to injury than when two or three are tied together, bat we send Peachen to all para in large and mall boxes, aingly, and by rail, and post, without the least bruising-using boxes sdaphed to the number of fruite to be packed into them, wo that firmness is premerved, which is the great emono tial to successful carriage. The time taken to puek a box of twenty-four fruit is about five minaten. I
grade and pack 60 dozon in three and a half houn, and this quantity I do almost daily during the buar eason, the largest number sent sway in one weel being 333 dozens, and the largest number in one day 131 dozen. Wm. Armstrong, Ioddington Orchard Co

\section*{SOCIETIES.}

\section*{ROFAL HORTICULTURAL,}

November 26.-The usual fortnightly meetiog d the Sociaty was held in the Drill Hall, Jame Street, Wentminater, on Tuerday last, when an interesting exhibition wa made, albeit the hall wu lesf full than on some previoa occasions. Cbryamthemume again conetituted one of the more importast items, and there were several novelties recognined by the committee. Orchide were not numerous, neither were frait exhibits, but there wat a large collection of Applen and Pearn, and another of vegetablen.

\section*{Floral Committee.}

Present: W. Marshall, Esq, in the chair; nil Menars. Jno. Fraser, Jas. Walker, H. B. May, H. Horbst, R. Dean, Gzo. Stevens, Jo If. Fith, Che Jefferien, J. D. Pawle, Chaw. E. Shea, J. W. Buri, Chas. E. Pearsos, Ed. Beckett, H. J. Jona, Gm Nicholson, Geo. Gordon, C. Blick, and Rvv. G. it Eagleheart.
A group of Rose trees in pots formed the exhibit of Mamb WM, Paul \& Son, Waltham Cross Nurseries, Hena,
variety was Enchantrese, described as a new wintor variety was Enchantrese, described as a new beddiag Rose, a hybrid between China and Tea-scentad and Some very free-flowered sprays were also shown, committee recommended the variety an Award of Ment. bloom is white, with lemon flush, but in the bud somin pleasing tint of fresh aalmon or pint (Silver Banimin
Mesgrs. Jno. Laing \& Sons, Forest Hill, Londan alim exhibited a plant of Dracsena Lentiginosa, with loag a
leaves, of good colour. Also Calamus Palembanicuss,
Mesgre. Jis. Veitci Sons, Royal Exotic Muspery,
Messre. Jas. Veitch sons, Royal Exotic Nuysery, do again exhibited their Javanioo-Jasminiforum hybria dodendrons, but on the present occasion the in plat cut blooms shown last time. Messys. Verter also plant in flower of Begonia \(\times\) Mrs. Heal, which wo reme plant in flower of Begonia \(\times\) Mrs. Heal, when Ensimp figured, and a variety of a similar strain named Meda) larger leaves and paler flowers (Silver Bankian M. W. Yous
From the Botanic Gardens, Glasnevin, Mr. Fo sent foliage and flowers of Sphæralcea umbelata (Hite form! bellata), a stove shrubby plant with Malvalite ton bright violet ; native of Mexico.
H. Gurining, Esq. Harrow Weald House, stanmen fin Mr. Repley), showed a plant of the vary old Canarins lata, a greenhouse herbaceous perennial with curper flowers of a curions shade of orange-purp
interesting, and not frequently met witho . Nomplow
Mr. J. Orawford, of Cod lington Hell Gardens, Xom Trent, sent cut blooms of Carnations. A handrome Begonia in flower was exhibited of m' Bewnett Pok, Eoq., Holmewood, Cheshunt, Leaves were nearly a foot across, handsome on under surface, the veing very conspicuous by re pale colour contrasted with the deep, but bright, bearing upwards of thirty flowers nearly? boaring upwards of thirly flowers acalo
ance of the plant in the hall was distinet and fine, and it probably excited more intereat than any other exhibit.

Cifrisanthemums.
Mr. R. Owex, nurseryman, Maidenhead, had a collection of new varieties, A wards of merit being made to the following:Country of Gold, a small Primpose-coloured narrow-petalled variety, very free, charming in sprays, and promising well for market and decorative work. Mra. Ellen Newbold, a pale yellow reflezed Japanese, broad petalled, of good size as a
decorative variety, and pleasing shape. Another promining decorative variety, and pleasing shape. Another promining
market flower, and incurved, Bonnie Dundee, having, in a true market flowar, and incurved, Bonnie Dundee, having, in a true incurved form, the oolours of Lord Brooke, but less of reddish-
brown and more of gold, a charming exhibition variety. In addition there were Oceana, a broad-petalled flower of the Viviand Morel type, white, with a delicate pink suffuaion: Walter Owen, reddish cerise, with a bronzy-yellow reverse, but rough asshown; and General Roberts, \&ce. (Silver Bankesian Medal).
From Mr. Welis, Rarlewood, Redhill, came incurved Sir Trevor Lawrence, a very promising white flower of the Queen Wells. As the Floral Committee declined to say whether or not it was a true incurved, no award was made ; and Major Bonnaffon was similarly treated, as no pronouncement was made as to the particular class, though recently shown in From Mr. W. Slogrove, variety. Reigate, came a grandly-formed and full incurved golden yellow Japanese, named William Slogrove, a flower of great refinement, which will make a very acceptable exhibition variety (Award of Merit).
From Mr. H. J. Jones, Ryecroft Nurseries, Lewisham, came anemone Japanese Surprise, pale lilac-pink, with faint stripes of purple (Award of Merit); Major Bonnaffon, in fine character; Mrs. P. Purcell, delicate purplish-pink, with ailvery reverse, a rery novel incurved Japanese; and Olive Ochree the golden florets with a bronzy revarse, much incurved, and II. Brisiscor - Irovside, in character (Award of Merit). Mr. M. Briscor-Ironslde, Burgess Hill, bad nome seedling Pompons, but to all appearance partaking too much of a mixed character; and Neve, a white Japanese of a decidedly promising character, if it can be grown large enough. Mr. W. Jukes, Weybridge, had Japanese Mrs. W. Maling-Grant a promising variety, a mixture of yellow-salmon and bronze ; a handsome reflexed variety. From Mr. E. H. Jenkins, Hampton, came a fine and showy yellow Japanese, Golden Dart, which was recommended an Award of Merit as a valuable market and decorative variety,

\section*{Orchid Committee.}

Present: Harry J. Veitch, Esq,, in the chair; and Menart. Jan. O'Brien (Secretary), T. B, Haywood, S. Courtauld, Dr. M. T. Masters, E. Hill, H. Wil-
liam, E. Ashworth, W. H. Protheroe, T. Statter, F. Hardy, J. Gabriel, H. J. Chapman, W. H. White, C. J. Lacas, J. Duaglas, and H. M. Pollett.

The meeting was a thin one so far as the exhibits were concerned, the only group of any extent being staged by Mesars. F. Bander \& Co., St. Albans, and for which they received a Silver Banksian Medal. The body of the group was composed of fine examples of beautiful hybrid Calanthes, varying in colour from cream and rose to purple. Among them
were \(\mathrm{C} . \times\) Bella, C. \(\times\) Florence, \(\mathrm{C}, \times\) Wm. Murray, \(\mathrm{C} . \times\) were C. \(\times\) Bella, C. \(\times\) Florence, \(\mathrm{C} . \times\) Wm. Murray, \(\mathrm{O} . \times\)
Bryan, \(\mathrm{C} \times \mathrm{Cl}^{2} \times\) Clive, and C. \(\times\) Harold, An intereating plant in Messrr. SAMDER's group was Phaio-Calanthe \(x\) Berryana (P. Humblotii \(\times \mathrm{C}_{\text {. Masuca), and which had bright rose- }}\) coloured flowers, with singular- shaped labellum, in which group were Phaio-Calanthe \(\times\) Arnoldiana, Pescatorea Lehmannii, P. Klabochorum, and the white Bollea Schroderiana, the rare Dendrobium Leeanum, Aganisia ionoptera, Angreecum polystachys, Brassia Lewisii, Leelia autumnalis alba, Habenaria Suzannee ; Sophronitis grandiflora, Odontogloesum Bictonense albuma, Miltonia Schroderiana, some fine hybrid Cypripediums, and the singular Bulbophyllum crassipes.
To Meegrs. Linden, \({ }^{1}\) 'Horticulture Internationale, Parc Leopold, Brusells, fell the honour of taling the only First-Class Certificate at this meeting, its award being secured by their richly-coloured Catasetum imperiale, about which opinions differ as to whether it is a crimson-purple C. Bungerothii, or a richly-coloured form of the variable C . \(\times\) aplendens. In any rase, it is the most gorgeous Catasetum known (see Gar deners' Chronicle, March 16, 1895, fig. 44). Mesors. Livden also showed cut spikes of their form of Cattleya maxima.
Sir Trevor Lawrence, Bart., Burford, Dorking (grower,
Mr. W. H. White), zent a very fine hybrid Cypripedium raised Mr. W. H. White), sent a very fine hybrid Cypri pedium raised
between \(\mathbf{C}\). Stozei platytreniumand \(\mathbf{C}\). concolor, and named \(\mathbf{C}\). \(\times\) platycolor. It had an infloreacence of three flowers and cue bud, the flowers equal in size to those of C. \(\times\) concolawre, cream white, flushed with rose, and with minute parple dots on the sepals and petals (A wand of Merit). Sir Trevor LawREwCe also showed Arundina Philippi, a slender plant with terminal sprays of rose flowers with crimson lip, like amall A. bumbusefolia (Botanical Cortificate),
Tros. Statter, Reqo, Stand Haul, Whitefield, Manchester variety, with Johnson), sent Cattleya aurea Marantina, a fine and sepals, over which spresd gold-veined lip, and yellow petals being marked with roeread a coppery hue, the petals aleo being marked with rove colour in a very effective manner
(Award of Merit); and Cypripedium \(\times\) plumosum (barbatum \(\times\) cenanthum superbum)
Mesars. Jıs. Veitcre \& Sons, Royal Exotic Nursery, King's \(\times\) Wullimio-clinge, and the theo singular hybrid Epidend rum
derived. On this oocmion it secured an Award of Morit. Meesrs. Voitch also showed the pretty Melayan Deadrobium Certificate).
J. W. Temple Etoq.e Leyswood, Groombridge (gr, Mro K. Bristow, ssant Cattleya \(x\) Misa Willisms (Harrisonie \(x\) labiata Gaskelliana), with pretty rosy-lilac flower, with crimson blotch on the lip; and C. Labiata, Temple's variety frae in form and colour
G. L. Palmarr, Eqq., Springfield, Trowbridge (gr., Mr. Ohas. Richman), sent Cypripedium \(\times\) Madeline (bellatulum \(\times\)
Argus), with yellowish-white flowers apotted with purple, Argus), with yellowish-white flowers, spatted with purple, and tinged with lilac (Award of Merit); also \(\mathrm{C} . \times\) Dibdin C. \(\times\) Seegerianum, and other hybrids.
C. J. Lucas, Ksq., Warnham Court, Horeham, showed Cypripedium \(\times\) Warahamensis (Curtisii \(\times\) philippinense). Sif Frenerick Wigni, Clare Lawn, East Sheen (gro, Mr. W. H. Young), showed fine cut examples of Epidendrum (Barkaria) Lindloyanum and Leelio-Cattloya \(\times \mathbf{W m}\), Murray. Mr. Aribble, gro to the Marchionees of Londonderry, Plaw Court, North Wales, sent Leelia anceps.
Messrs. Hugh Low \& Co., Clapton, showed Oacidium hematochilum, Phalænopeis Bry
some pretty Cgpripediums, \&c.
Stanley Clark. Eeq., Oak Alyn, Wrexham, sent Cattleya Trianeei Mrs. Stanley Clark, a noble form, with rich crimsonpurple lip, and a feather of the same colour on the petals.
F. W. Moore, Rsq., Royal Botanic Gardens, Clasnevin, Dublin, sent an extraordinary Calanthe (named provisionally F. W. Moore), with a fine head of lilec-purple flowers, which on reaching maturity, become light rose, the lip changing to bronzy-gellow (Botanical Certificate); Masdevallia Chimeera bronzy-yollow (Botanical Certificate): Masdevallia Chimeera
aurea, in which the flowers have large patches of clear jellow aurea, in which the flowers have large patches of clear yellow
on the sepuls (A ward of Merit); Odontoglosum preastans, and on the sepals (Award of Merit); Odoatoglosum preestans, and
the pretty Phaius Bernaysii, from Fiji, with white flowers the pretty Phaius Bernaysii, from Fiji,
with chrome-pellow face to the segmenta.
T. W. Swinburme, Kaq., Corndean Hall, Winchcombe, nent Cypripedium \(\times\) Walleertianum (Harrisianum \(\times\) villosum).

\section*{Fruit Committee.}

Present: T. Francis Rivers, Erg., Chairman and Mears. H. G. Pearson, Jas. H. Veitch, Jon. Cheal, J. Wright, Alex. Dean, J. W. Bates, Goo. Wyther, Jas. Hudson, H. Balderson, G. Reynolde, Gso. Norman, Robert Fife, and Philip Crowley.
Exhibits of fruit were few. The largest of these was a collection of Apples and Pears from the Lowield Nurseries of Messrs, J. Cheal \& Sons. Crawley, which included 100 dishes.
The moat attractive of the Apples, by reason of their large size or good colour, were Blenhoim Orange, Ribston Pippin, Alfriston, Jabllee, Now Hewthornden, King of the Pippins, Peargood's Nonsuch, Cor's Pomona, Horeford Beofing, and Bis marck. of the last-named, excellent fruits in regard to both size and colour were show, whilst their fresh-looking appearsize and colour ware show, whilst their fresh-looking appearance proved that they will
(Silver Knightian Medal).
There were several exhibits of seedling Apples, including Stubb's Seedling, a Quarrenden-like fruit, but a good keeper also before the committee on a pravious occasion. The committeo resommended an Award of Merit to this variety, the exhibit of Mr. W. PA LMER, Andover; and requested that Mr. E. STEW \(\perp\) RD, 57 , Carriugton Street, Nottingham, whoex hibited fruits of a pale yellow variety with russety spots and blotches, fruits rather flat-looking, with deep eye, would exhibit same on a future occasion.
A variety named Palmer's Favourite was shown by Mesara Jno. Laime \& Sons, Forest Hill Nurseries, London, Sow.; and another one named Christmas Pearmain, was ohown by Mr. Geo. Wrters; and a double Apple, caused by the fuaion of two fruits, was from Mr. E. APPLIBT, Dorking, Surrey.
Mesars. Lane \& Son, Berkhamsted, exhibitod excellent specimens of their Apple Lane's Prince Albert, gathered from trees in the open orchard twenty yeary old (Vote of Thanks).
Mr. Jno. Crook, gr. to W. H. Evans, Keq., Forde Abbey, Chard, showed a dish of amall red Plums, of the variety Coe's Late Red.
A Tomato of the Perfection type, named Nield's Seedling, was shown by Mr. W. Nield, Horticultural College, Cheshire, and was referred to Chiswisk for trial.
dieh of Jerusalem Artichokes, Vilmorin's New White was shown by Mr. Wythes, and also a dish of Wythe's seed ling Poksto, a kidney, from a cross between Myatt's Prolifie and Beauty of Hebron, said to be ready for use nine week after planting, and of good table quality (referred to Chiswick). Bine with fruits of Tomato, All the Year Round, certificated in April last, were exhibitod by Mr. Fars, gr. to A. Prars, Esq., Spring Grove, Isleworth; the exhibit well represented this variety's free bearing qualities in November.
Earl of Peroy, gyon House, Brentfond (gr., Mr. G. Wythes), supplemented his previous exhibits of regetables by another another one consisting chiefly o: green krinds, which included about forty sorts of Brassicas, some forcod Asparagus, alco Syon House sad Veitch's Improved Telegraph Cacumber, and some Moush and Veitueks in several varietios were commendable. Mushrooms. Leeks in eeveral varietiee weer commendave
Veitch's eelf-protecting Broccoli, the green curled Savoy, Veitch's self-protecting Broccoli, the green curfed savoy,
Cottagera, Asparague, arctic and other varieties of Kales, and Coleworts, were all represented by meritoriozs produce. Ot Braseels Sprouts we noticed Veitch's Exhibition and Sutton's Dwart Gom, the latter as being a short-stemmed variety, thickly furnished with mall close spronts from base to aper (Silver Knightian Medal).

\section*{Lecture on Asparagus Culture.}

The lsoture in the aftermoon wat apon Asparagus culture. by Mr. Jas. Mason, a market a rower. After briefly alluding to the botanical affinities and characteristics of the plant, as well as ite native habitats, the lecturer declared that after cultivating the common Aeparagus for many years, he was mpreseed by the fact that Briturh growers allow far too much foreign-grown produce to be imported into this country. English "buds " were admittedly less in size, but they were of undoubtedly better quality, and aufficient ought to be produced to supply the London market entirely. This delicious vegetable was convenient to the growes in regard to seading it long distances, beiag easily packed, and of comparatively inaignifloant weight.
In respect to propagation by means of seede, Mr. Mason had reveral points to insist on with emphasia, seed should not be sown in the autuma, nor in May, ta some growers have advocated; but in March, preforably towards the middle of the mon th, or when the weather was sufficiently open. The reeds were some little time before germinating, and if sown in autumn were very liable to rot; on the other hand, the ground was unaally too dry during May for them to germinato at freely at was desirable. Seed should be sown in drille about 1 foot asunder, sown rather thinly, and afterwarde the plants thinned to 4 inches or more apart. Before sowing, the land should have been given a winter's good cultivation, by well trenching, and afterwarde thoronghly pring it. The aim should be to secure really hard, atrong produce sufficient plants to plant an acre of land the foed would produce sufficient plants to plant as acre of land the following year. In regard to land, the Asparagns was not very fas-
tidious. The soil generally near the coast suited it well, if there was sufficient depth. Indeed, any soil of good texture and sufficient depth was sufficient, providing the same was porous. The last-named condition was an essential one in any case. Rough, wet land would always be unsatisfactory. When the seedlings are above ground, the surface of the land ehould be hoed, and some weak manure-water given to oncourage as good growth as poosible. Planting should be done the following apring assoon as the " buds" began to move. It wae best to select the strongest plants, and leep them to themsolves, thus obtaining even bed. Only one-year-old plants should be used, and it was better to now reed as advined, and then replant, than to sow, and thin to the distance required in permanent beds.
If green Asparagus was required only, the crowns need not be deep, about 3 inches of soil and mulching being quite surficient; but there were several advantages connected with the deep-earthing system. It was a protection from frost, and from the light, and atmosphere. The buds were much better also. Mr. Mason would advise a medium course by patting good manure, mat chould be srowing. proforally duriag the monthe June, July, or Auguat at the rate of 5 or 6 owt. per acre. If the beds were well may last twenty, thirty or even forty gearen afterwards, they never be cut after midsummer, how forty years. Buds should induce the formation of small, howerer, or the practice would If it was wished to cut Amparagus for the following season. be cut from a portion of the land only. the cot date, it should be cut from a portion of the land only: the crowns would continue to produce bude until Soptember at least, and it would well to throw those crowns away.
The French method of culture was then nlluded to, Mr. Mason saying that the Erench growors planted at greater distance apart, at greater depth, and obtained larger but fower "buds " per acre than English growers. Asparagus sbould be cut carefully, and a proper toothed knife always used for the purpone. Assoon as the "buds" were about 2 inches above-
ground was the best time to cut them. In conclusion, the lecturer said that cottagers might easily cultivate Asparagus if they so deaired, and thus secure for their tables the fineat of all vegetables.

\section*{ULSTER HORTICULTURAL.}

Novembre 12.-The above society held it annual Cbryanthemum, fruit, and vegetable ahow on the above date in the Great Hall, Belfant. The unual enthuiasm wan more manifest than ever, probably by reason of this being the finest show ever seen in these parts. The exhibit were of high order of merit, and their number more than doubled thone of 1894.

The rockwork set up by Mr. MCKIMM, Ourator of the Belfast Botanic Cardens, was a great point of attraction for visitars. The ahoes of water, the bridge whif ch could be cromed, the great variety of folizge plante, hardy and exotic, made meo of, and the noble Palms, the Ferns, and other plantaso genaromaly made use of, appeared to afford much pleasure.
Close to this exhibit was, in a cultural nense, a grand diapley of exotic plants from the gardens of J. B. HoUsTon, Exq. Orangefleld (gr., Mr. Gras). Of this colloction, Codiaeums (Orotone) formed the larger part, and their leaf-colouriag wat very fine. Interspersed with theoe were Palms, Fern, Ficus, and Dracsenan, and an edgiog of Ivy and mon gave the whole an appropriate artistic flaish.
Pasiog long linew of Roman Hyacinthe, Mignonette, bouqueta in great numbers, Carnations, and table plante, the onlooker came to the exhibits of Messre. H. DICKson, viz. foliage plants, both hardy and exotic, in great variety, flowering plants, Conifers, and hardy thrubs, to which a lot prize was awarded. Other varied and attractive groups came from the The Pames Commriter went their quota, consiatiag of
grand groups of pot Chrysantherchums of somewhat dwars habit, of good width, with vigorous foliage and fine flowers, Mr. Mahappy, the gardener, holds a leading position as grower.

\section*{Cut Blooms.}

The Countess of Pemproke, Mount Mertion, Dublin, was 1st for thirty-sir cut Japacese varieties, a capital lot containing many ercellent new and old varieties. T. H. Torress, Esq., was 2nd with a capital lot of rather lesseven character than those which came from Mt. Merion. J. G. Smallman, Eeq., was 1gt with twenty-four, his flowers of Viviand Morel, A. Perry, and Nivenm, being extra fine ones. Many fine exhibits were noted in the smaller classes. The Countess of Pembroke was easily 1st for six white blooms ; and J. RoGERS, Esq., for sis yellow ones, consisting of finely-grown blooms of Sunflower
Twenty-four incurved blooms were well represented, Golden Empress, Princess of Wales, and Lord Alceater being the more prominent ones for size and fineness. The six blooms of Japanese and six of Anemone-flowered varieties were of much merit, eapecially the latter. The names of their owners we were unable to discover. A weak point in these shows is the withholding the дames of the cultivatore.

\section*{Fruit.}

Among the leading exhibitors of fruit were General O'NetL, Lord Downshire, and General Pakentin. The trade was well represented by fine collections of Apples and Pears from Messes. Rivers \& Sors, Sawbridgeworth; Messis. McGredy (Son, Portadown ; Mr. Geo. Dickson, Newtownards, and others. Alongside on the tables were about 700 dishes of bril-liant-coloured Applea, and many dishes of generally good Pears, and an extra large display of Potatos. In at least two of the competing collections an exhibitor defeated his chances of success by dusting a white substance over his tubera-and was disqualified.
In the Grape classes, Lord Downshire (gr., Mr. Bradshaw) took the lead, and received a special award for a collection o lour varieties. Lord O'Neil's and Mr. Johnston's gardeners were well to the front in the choice fruit classes.
Lord Anyesley was a leading exhibitor in the vegesable classes. Knormous Leeks and heads of Celery in great quantities, and good Cauliflowers, were the vegetables which were the finest in quality. The Parsnips and Beet wero too large and coarse for ordinary use.

\section*{TWICKENHAM CERYSANTHEMUM.}

November 19 -A thorough representative show was held on the above date at Twickenham. Chryeanthemum were the chief feature, but other exhibits were alao numerou and good. There were only two competitore for the prizes for groaps, but each of these made good diaplay, which combined quality in the plante with effective arrangement.
The best came from Mr. Riclewood, gr. to Lady Freake, the blooms in this case being the finer; Mr. G. H. Sage, gr. to Rayl Dysart, Ham House, Richmond, was 2nd, and his plants were dwarfer than the others.
For a miscellaneous collection of plants, Mr. H. F. FordHiM, florist. Twickenham, had much the best arrangement, and consequently won quite easily.
For twenty four Chrysanthemum blooms, incurved and Japanese in equal numbers, Mr. Portrury, Ripon Hoase, Putney, was worthily 1st, with an even exhibit, comprising the best-known varieties; Mr. C. J. Waite, gr. to Hon. W. P. Talbot, Kaher, was 2nd, quality of the incurved varieties costing him several points.
Mr. Portbury also had the beat twelve incurved blooms in another class, Mr. Braby being 2nd. The same positions were taken by these exhibitors in the class for twelve Japanese, the contest being a close one.
The class for Pompons was a capital one, Mr. Chas. Garrod, kr. to J. R. Tindıle, Eeq., being 1st; and Mr. Brahy 2nd.
Floral decorations made a notable feature, the most succeseful in this section being Misa C. B, CoLE and Miss N. H. Cole, who both dieplayed excellent taste.

\section*{NATIONAL OHRYSANTHEMUM.}

Novingere 20.-The Floral Committee met at the Royal Aquariam on the above date, a coaniderable number of noveltien being staged.
First-clase Certificates of Merit ware awarded to incurved Bonnie Dundeo, pale bronzy-yellow, of lovely ahape, and highly refined; and to Japanese Anemone Robert Adair, delicate flesh, with drooping petals, attractive in colour; both from Mr. R. OWEM, Maidenhead. To Japanese M. M. D. Chatin, a creamy-white incurved Japanese, a large, full flower of good quality; and Jules Chrétien, a large, broad-petalled incurved Japanese, of good substance; trom Mr. E. BECKETT, Aldenham House, Kistree. To single Kato Williams, bright yellow. large but somewhat loose; and to Japanese Parthenia, a delicate blueh reflezed Japanese, small in size as Japanese go now: both from Mr. H. J. Jones, Lewisham. To Japaneee Surpane Amiral, a large yellow Japanese of full substance, partly incurving and partly reflexed, with an inelination to roughMen ; Hem ki. E, CALYAT, Grenoble, Frazce, And to Japanene Mra. Hermann Klow, roddish-bronze and gold, also with a tendency to loosenese; from Mr. WILLLAM SEW ABD, Hanwell. The following are of a decided promising character: Japanees Luino, bright yellow, very pleasing in tint; Japanese Stresa, pale yellow ; and Vignolo, of much the same colour, but

Graphic, warm pink, with silvery reverse; from Mr. R. Ower. apanese Desdemona, a delicato blush-pinly reflezed Japanese, from Mr. H. J. Jones.

November 27.-A good namber of noveltien were staged on this cesasion.
First-clas3 Certificatos were awarded to William Slogrove from Mr. W. SLoGrove, and deacribed in our Royal Horticultural Society's report of the previous day. Japanese Anemone Surprise (R. OWEN), and to Japanese Olive Oclee, both previously described. Japanese Madame J. Bernard, delicate Viously described. Japanese cadame J. Brranged in a kind rosy-lilac, with ilvery reerse, hed to see it again. Other proof whorl. The committee wished to see mising flowers were etaged which will, doubt, be seen again in better condition next season.

\section*{YORK CHRYSANTEEMOM.}

November 20. - Tae Ancient Society of York Florist opened their annual exhibition of plante, flowers, fruite, and vegetables in the grand hall of the Fine Art Institution at York.
The exhibition of Chrysanthemums, considering the lateness of the date for such an early season, was very good. One of the principal features of the show was the splendid collections of Apples exhibited by Messrs. Backhouse \& Sox, York; Messrs. G. Bunyard \& Co., Maidstone ; and Mr. John WaTkINS, of Withington, Hereford. They were the most magnificent ever seen in the north of England.

\section*{Chrysantremuas.}

The competition for the prizes offered for groups of Chrysanthemums arranged with other foliage plants, was very good, the lst prize going to Mr. Cotham, nurseryman, Cottingham, Hull. 2nd, Mr. J. H. Kingston, York. The groups were very effectively arranged around the sides of the great hall. Circular groups of Chrysanthemums, cultural merit being the chief point of consideration, were arranged down the centre of the hall, and somewhat detracted from the effect produced by the side groups. A grand effect would have been produced had they been grouped right round the hall. The lst prize had these was taken by Mrs. Gurcri, of Yorl; 2nd, Mr. W. B. for these was taken by Mrs. Gutcr, of York; 2nd, Mr. W. B.
Richardson. Very excellent blooms of the best varieties in Richardson. Very excellent blooms of the
cultivation were shown in all these groups.
Open class for specimen plants of Chrysanthemums. - Ia these, the compatition was not great, but some good inourred varieties were shown by Mra. Gutor, who was lat in the class for four plants with Mr. G. Ruadle, Mr. Glenny, Ro Cannell, and Mrs. Dizon; 2nd, Mr. Dickensor.
Mr. Dicrenson was 1st for four Japanese; 2nd, Mrs. Gutcri. Cut blooms.-The competition in these classes also was not so large as we have seen previously. Many exhibitors who entered, no doubt owing to the warm weathy ex, were unable to appear. The lst prize, \(£ 10\), to which is added the Citizens' appear. The 1 st prize, \(£ 10\), to which is added the Citizens
Challenge prize, value \(£ 3\), for thirty-six blooms, eighteen incurved and eighteen Japanese, was taken by Sir James Walker, of Sand Hutton, Yorly, with a grand lot of flowers eapecially of the incurved varieties, waich included Empress of India, Golden Empress, Baron Hirsch, Hero of stoke Newington, Princess of Wales, Princess Teck, Mrs. Coleman, J. Agate, Jeanne d'Arc, John Lambert, and other good varie ties; among the eighteen Japanese were Mrs. H. Payne, Madame M. Hoste, Viviand Morel, Col. Smith, Miss D. Shea, Madame M. Hoate, Viviand Morel, Col. Smith, Miss D. Shea, prize went to Mr. A. Milnethorpe.
The best twelve blooms, incurved, one variety, were from the Earl of Faversiam.
Eighteen incurved blooms in twelve varieties were bast from C. H. Simpson.
Sif James Walker won for eighteen Japanese blooms.
The class for eighteen blooms, open to gardeners and amateurs residing within 5 miles of York, to the lat prize for which is added the Citizens' Challenge prize. lat was won by Mr. W. B. Riceardson; 2nd, Mrs. Gutcer.

\section*{Fbutts.}

Pears and Apples were shown in splendld condition. Pitmaston Duchees Peara, and Ribston Pippin Apples, shown by Lord Hotham and Sir J. W. Pease, were prodigious in size, and excellent in colour. Qrapes wore not quite up to the standard of former years. In the olean for wix bunchen, in atandard of former years. In the olane for niz banches, in
three varieties, the let prize was taken by Lom Hotema, three varieties, the let prize was taken by Lord Hoteam, well-finiahed bunches of Muscat of Alezandrian, Alicante, and Mrs. Pearson; 2nd, Mr. R. H. HEYWOOD Jones; two bunches of Black Grapes were also best from Lord Hotinar; two bunches of White Grapes from Mr. ARTEUB Wirsox.
For a collection of fruit in six varieties, Lord Hotifam was 1st, and Sir W. Peast 2nd.
The best six dishes of bakiag Apples were from Lord Hotiam, and sim diahes of dessert varieties also. Lord Hotham, and six diahes of the beat nix Pears.
sir J. W. Pease was lat in the class for nine dishes of Apples, and six dishes of Pears; with Apples-Gascoigne Seedling, Royal Russet, Bismarck, Ribston Pippin, King of the Pippins, Court Pendu Plat, Blenheim Orange, Adams' Poarmain, Manchester Pippin. Pears: Jocephine de Malines, Ĺón Le Clerk, Marie Louise, Ne Plus Uitra, Durondeau, Pitmaston Duchese-splendid diehos.

\section*{Vegetables.}

Mesurs. Sutton \& Sors, Reading, exhibited a mplendid collection of ninety varieties of Potatos, which wore a great

In the open classes for vegetables, the principal prize-taken were Sir J. W. Pease, Messrs. Sangater \& Soizo-takem Waite, Mr. G. Welby, Mr. J. Sutton, Mr. J. Whitrifid, Mr. J. G. Thraxton, and Mr. Wragg.

\section*{SOUTH SHIELDS AND NORTHERM
COUNTIES CERYSANTHEMOM.}

November 20, 21.-The above nociety held first exhibition in 1882, but after 1886 became defanct until renucitated again in 1890 . The shom heo every year aince improved, and the one held on the 20 Hh and 21at inst. in the Royal Anembly Fill South Shields, wai the best the nociety buheld,
For twenty-four Japanese, eighteen varietioe, then men ten competitors
For twenty-four Japanese, eighteen varietiex, \(\mathbf{M}_{\mathrm{p}}\), J. Wheeler, gr. to Mrs. Mitchell, Jesmond Tower, lemeth was 1st, amongst ten competitors; his best flowers wer Viviand Morel, Chas. Davis, Mrs. C. H. Payae, Boole dor Miviand Morel, Chas. Davis, Mrs. C. H. Payne, Bolle don Mr. G. J. Nofford, Mdlle. Thérè se Rey, Kra, Knowlea
Niveum, Sunflower, Waban, and Duke of York. Mr, \(G\), Niveum, Sunfower, Waban, and Duke of York, Mr, a For twenty-foar incurved blooms, eighteen rarieties, Mr, Shotton was 1st. Mr. Shotton is a new exhibitor, and bidi fair, along with Mr. Wheeler, to do honour to North umberland. Mr. Jis. Coultas, gro to Alderman Habdirem Hollyhurst, Darlington, was 2nd; and Mr. J. BLaIR 3nd the first were a fine lot, and the judges were most emphatic in their praise.
For eighteen varieties, Japınese, Mr. T. J. Wheruer wee, with flowers and bunches equally good as those in the then for twenty-four blooms: Mr. P. BLAIR was 2nd.
Mr. G. SHotror was lst for aighteen incarved boma; and Mr. Jıs. Coult 4 S was 2 nd .
- For twelve Japanese, Mr. Peter Blatr was ist; and bro like number of incurved, Mr. G. Shottor won.
The best sir bunches of Pompons were shown by Mr, T. J. Wheeler; and for twelve \(A\) aemoneflowered, \(M f, G_{0} C_{0}\) Smite, Floral Cottage Hall, was 1st. Whilst for tmiw eflexed, Mr. G. Shotron was the most successfal.

\section*{Bouquets, \& C.}

Epergnes and bouquets are always an important fenture of this exhibition. One centre table, the entire length of the hall, was flled with admirable exhibits of this description The best bouquet was from Mr. J. SUMMERS, Fawcett, Sunder land; and Mesars. Perkins \& Sons, Coventry, were 2nd. For bridal bouquet, these exhibitors occupied the same poaition
The epergnes were tastefully arranged, and containod may ohoice flowers. Mr. Thos. Bateensby
don-on-Tyne, was lst for dinner-table.
For bunches of Chrysanthemums and for ledies' spash Messre: Perinins were 1st ; and for batton-hole bouquot, y. J. McKonzie, gr. to the Rev. R. Burdor, Heddon How Wylam-on-Tyne, was 1st.

Plants.
For a group of miscellaneous plants, not exceseding 10 forb by 8, there were four competitors, Mr. Jno. MeIntyre, gri th Mre. Gurney Pease, Woodside, Darlington, being lit; theod arrangement was of his usual artistic manner. Mr. J. Wod arrangement was of his usual artistic manner. Ma 2nd.
Rr. to ED. Hopper, Eisq., Riverside, Morpeth, wal 2nd
There were classes in this section for table and misodramy
The amateur classes were well contestel, and thaw Grapes in open classes especially so.

GLASGOW OERYSANTHEMUM, FBUL
AND VEGETABLE.
November 21.-Thim show, the second held if Glasgow, was an improvement on that of lut jur The St. Andrew' Hall, in which it was held, filled throughout with an excellent dieplay of cuyp anthemums, arranged with tablew of planter 10 un relieve the monotomy of a diaplay of merdy flowers. The towering Palm, foliage plants ram \&cc., called forth favourable commenta on andil) and were most creditable to Mr. Dewar (pr Mr. Canningham and Mr. Wyllie (secretariat), the other promoters who had apared neithor of nor trouble to render the display worthy of wentern capital of Scotland.

\section*{Cut Blooms.}

The lst prize, contributed by the Corporation of aly Was gained by Mr. J\&MRS DAY, gro at Galloway thirty-siz blooms (Japanese), which were in the first-rate, and equal to any seen elsewhere in tha 2nd prize went to Mr. James Brigs, \({ }^{\text {gro, }}\) Mrochina
M. Nicol, gro, Rossie, Forgandeny, wis class of twenty-four Japanese, and well sustaining tion as an excellent cultivator. His bloona of in received an Award, as being the finest bloom in and he had several other grand flowers. Dunfermiline, was a good 2nd. This wha a clast in competition was rather severe. All the order.
Japanese varieties brought exhibits of high order of hre The incurveda were mostly finer in iorm numerous ardil. Mr . Day led well with excellent blooms in the clans of with and Mro JFo. ClaßKE, gro, Selvirly, was 2nd, formed blooma.

For twelve incurred and twelve Japanese, Mr. Nicol was st, with a fine exhibit; and Mr. CLARIE was 2nd. The last exhibitor was lst among many of the minor clases, for sir grand blooms of E. Molyneux.
In the clasess for amateur exhibitors, many fine blooms were tabled.
There were several tables in competition for effect which were brilliant with plants of dwarf Chryeanthemame and foliage plants. Mr. Arcaibaldo gro. Bothwell Castlo, was list, with a somewhet crowded table: Mr. DALE was 2nd.
Table Plants, which divided off the long lines of Chrysanthemum blooms, were said to be the Gnest display of the kind previoully been in Glasgow. Mr. La mdsbozough, gr., Beech Wood, was lst for six plants which could scarcely be surpaseed. His Orotons, Chelsoni and Prince of Wales, were greatly admired.
Specimen Chrysanthemums, in pots, although better than last year, called forth no apecisl comment. Ruman Hyacinthe were not equal to the display last year, still there were some fine half-dozens exhibitod. Among special awards, Mesars. Thyne. Austir \& McAscin were well to the front with tables ThyNE, Austin \& Mcaslin were well to the front with tables Flowers, Swanley, Kent, had fifty or more beautiful bunches Flowers, Swanley, Kent, had fifty or more beautiful bunches
of their choicest zonal Pelargoniums, which attracted many of their choicest zonal Pelargoniums, which attracted many
admirers. All shades of colour, from the white Sea Gull to admirers. All shades of colour, from the white Sea Gull to Royal Purple, were in capital form.
Mesars. Cross had grand Peara and Gros Colmar Grapes; Mesis. Smite en Eimons had a splendid display of potatosabout filty large dishfuls, and all handsome; Messrs. Buchavaw, of Forth Vineyard, had an attractive exhibit of Grapes in baskets, large in berry, and beautifully coloured. Their colection of Vine-leaves of brilliant colours was very attractive, and the baskets of Tomato-fruite were finely-coloured, and of capital quality.
Huge Palms for competition decorated the orchestra.
Messrs. Dobbie \& Co. had a large table of Chrysanthomums in the leeser hall, loaded with many of their choicost seedlings, io the lesser hall, loaded with many of their choicest
one of the forms quite distinct and very beautiful.
Orchids were few. Mr. Mitchell. gr., Bantoskine, was let for a plant of Cattloya labiata, densely loaded with blooms; Mr. Wrusor, gr., Kelvinside, was 2 nd , with a plant of Cypripsdium insigne, of an immense size and plentifully fowered.

\section*{Fetert.}

This made a gooi show. The classes were not numerous, but all were well represented. Mr. LisLiE, \(g^{\circ}\)., Pitcullen, as usual, was in great force; his Grapes were Jarge in bunch and berry, but his Gros Colmans were not equal in colour to what he generally tablen; but his lst prize bunches of Muscats were first-rate. Mr. Murray, Parkhall, ran Mr. Leslif, hard in the various classes: Mr. Ormiston, gr, Johnston, had some faely-coloured bunches in the black Grape classes. Mr.
Murray was lat for Lady Downes; and his bunches of Murray was lat for Lady Downes; and his bunches of culture.
Apples were well represented, and Mp. Diy's collections of deasert and culinary varieties were far ahead of all others. Mr. Angus, Dalzell, was 1st in the larger clasv for Pears, his dishes of Marie Louise and Doyenné du Comice being about the best seen in Scotland. Mr. Day showed well in this class.

\section*{Vegetables.}

These exhibits were on the whole somewhat coarte for a Glasgow exhibition. Leels and Celery were in great quantities; Caulifiowers remarkably gool-Veitch's Protecting formed the lat prize axhibit from Mr. STEWART, gro, Koock. difry Castle.

For a collection for ten sorts there was strong competition, and Mr. J. Brown, gro, Houston House, greatly distanced his competitors with a firstrate exhibit; his Cucumbers, Celery, French Beans, and roots were as fine as could be desired. M. Temple, Carron.

\section*{NEATH CHRYSANTHEMUM.}

Thr above Society held ite annual show in the \(G\) wyn Hall recently, the dioplay being the beat jet made by this Society.

The csmpetition was keen, expecially in the out-bloom action, and some of the best known growers in the Principality were present. Groups were very satisfactory, the lst prize exhibit in the open clas being an excellent one. The smateurs' and cottagers' exhibits have very much improved. Fruit was well repreeented; whilst with vegetables, Mr. Foster, gr. to Mr. Wriliams, Aberpergum, who has been so puccessful all the season, was invincible. Messrs. Clibrar of Manchester had a fine collection of fruit and cut bloums of Chrysanthemums; Mr. LLEWELLYN of Neath also had a fine atand of fruit and plants.
Mr. GWYM (gr., Mr. Bradley), won 1st place for a group in the open clase; 2nd, Mr. H. Price-both of Neath.
For bix specimen plants in pots, Mr. Bradeer was lat; and
Mr. Price was 2nd, Mr. Price, was 2ad.
The chief prize in the cut-bloom section was for twenty-four booms, Japanese and incurved, to be included in equal numbers. There were seven entries, and Mr. Williams, gr, to the Earl of Lisburne, Crosawood Park, Abaryatwith, was 1at, With a graud collection, his chief blooms being Mrs. W. H. Lees, Charles Davis, Viviand Morel, MdUe. Thérese Rey, and Variety gaining the special prize for best blooms in the show; and Mr. C. B. Whitnal, Mrs. R. King, Golden Empress, Lord Aloester, and Brookleigh Gem, amongst the incurves. Mr. Dumble, gr, to Sir Cearlis Phicip, Picton Oastle, HeverPord Weat, was a goot 2nd; and Mr. Rogert, gro to Mr. Chrye,
Llanolly, Snd.

For twelve incarved, Mr. Dumble was 1st, and Mr. Williams 2nd.
The best collection of twelve Japanese came from Mr. Joy, gr. to Mr. Bowring. The Heath, Cardiff, in a division open only to growers in South Wales and Monmouthshire.

The best collection of twelve varietiep, iocluding equal number of incurved and Japanese flowern, Mr. Williams was
lst; and for twelve incurved blooms, Mr. DUMble was the lst; and for twelve incurved blooms, Mr. DUMBLE
beet exhibitor; Mr. Joy winning for twelve Japanese.

\section*{ATLESBUAY CHRYSANTHEMUM.}

November 21.-The aeventeenth annual exhibition of thas Society wae held in the Corn Excbange on the above date, when the average quality of the exbibits compared favourably with that of 1894, the quality being good, and in some instances noteworthy.
Mra. Bartlett (gro, Mr. W. Turnham), secured for the third time the silver Challenge Cup offered for the bent group of Chrysanthemum plants, which now becomes the property of the exhibitor.
Ia the open clasees Mrs. Barthett wan successful in the olase for forty-eight cut blooms: and Lady A. DE RoTHsCHILD (gr., Mr. H. Warren), was 2nd in the same class, and the winner of many other priz 8 . The quality of the blooms in this class was exceedingly satisfactory, and the disparity between the two most sucoessful exhibitors was very amall indeed. In Lady A. DE ROTHSCEILD's stand was an excellent bloom of Robert Owea, selected by the judges as the best in the show.
The open class for thirty-siz diatinct blooms wae won by Mr. H. Gurney; and Col. Lee ( \({ }^{\text {mpo, Mr. Lee), 2ad; whilst that }}\) for twenty four blooms distinct, was taken by Mrs. Birtlett. Lady de Rothscirimo had the best siz Anemone blooms.
Among the exhibits in the classes for trained plants, was an excellent specimen of \(\mathbf{W}\). H. Lincoln with 200 blooms upon it, shown by Mrs. B\&BtLeTt in the specimen class.

\section*{NORWICH HORTICULTURAL.}

November 21, 22, 23 -An excellent exhibition wat held in S. Aadrew's Hall, Chryanthemums forming one of its principal features, and improvement in all sections was noted, except in the incurved.
Cut blooms were many and good, and the 1st prize for fortyeight distiact Japanese varieties fell to Mr. Allan, gr. to Lord Siffifld, Gunton Park, the blooms, comprising the leadink varieties, beingexcellent; Mr. Rogers, gr. to Lord Rennlesham, Rendlesham Hall, came io a good 2nd.
The best thirts-six Japanese, of Norfolk grow th, came from Mr. Oclee, gr. to the Marchionese of Lotisian, Bliekling Hall. The best iwelve Japanese varieties, open, were those ebown by Mr. Messenger, gr. to O. H. Berirrs, Esq., Woolverstone Marr. Messenger won elso for six Japanese with an equally Mr. MESS
Mr. J. O. Shiddick, gr. to Hon. A. E. Fellowrs, M.P, Mr. J. O. Shiddick, gr, to E.n. A. E. FELLOWE, M.P,
Honingham Hall, had the best incurved apecimens, which werefairly guod. Mr. F. Kirl, gr, to R Cross, E:q.. Worstead, was ist for six incurved of any one variety, namely. Empress India; and also for reflyed and A nemone Pompon varieties. Pompons made a fine display in the twelve varieties class, shown in bunches of six blooms. Mr. J. Esatwood, gr. to J. Sutton. Eer, Tolegraph House, Great Yarmouth, was lat with blooms of leading varieties; Mr. W. Turner, gr. to Dr. J. Wilson, Great Iarmouth, being a close 2nd.
In the competition for the be \(t\) twelve Anenone flowered, and in that for six bunches of single flowered varieties, Mr. and in that for siz bunches of tingle flowered

\section*{Plants}
showed improvement on former years. Mr. G. Wodehouse, gr. to H. Trevor, Eeq., Plaotation, Norwich, was the wianer in the class for six Japanese, with well-flowered plants ot suitable varieties; and Mr. Fisher, Kr. to E. Masters, Esq.. Flixton Park, Beccles, in that for Pompon varieties, with remarkably well-flowered plants of W. Weatlake, Cedo Nulli varieties, \&c. Mr. Bolton, gr. to J. G. Syellivg, Esq., Eaton Eall, was an easy lat for six plants in reflexed varieties, likewiee for nix inourved varieties. Mr. NotcUTT, Broughton Road Nursery. was awarded a First-Class Certificate for Japanese Nursery. was awarded a First-Class Certificate for Japanese
Chryeanthemum Edith Tabor, a pure yellow-flowered variety, possessing great merit; and a similar award was made to Mr. NoTcUTT, also for incurved Major Bonuaffon, orangecoloured.
Mesars. DLYEL Bros. showed Chrysanthemums, frait, a variety of plants and of vegetables, which added oonaiderably to the attractions of the show.

\section*{MANCEESTER ROYAL BOTANIC.}

November 22, 23 - The Chryanthemam Show under the auspices of the above society, was held in the Town Hall. Tha exhibite generally were of excellent character. The pot plants, although showing evidence of being retarded, were full of welldevelopad flowert, and cast fice mastes of colour along the aiden of the apacious hall. The incurved blooms were highly meritorion, the chief prizetakers puttiog ap an unusually well-growa assortment. The Japanese were carcely so good apon the whole, althoagh in much greater number than
we bave seen them at previous exhibitions of the cociety. The cat fowere generally comprising those grown indoors and those grown outdoorn, were clean and brilliant. What alway adds to the features of the November exbibition, it the grand diaplay of Orchidr, comprising Cattleyas, Dendrobiame, Cypripediums, and Sophronitis from various exhibitorn.

\section*{Planta.}

The finest collection of nine came from T. Harker, Emq.. Bank House, Fallowfield, followed by G. H. GadDUM, Adres House, Didebury, and by J. C. Chorltor, Erq., Didebury Priory, these gentlemen taking the best positions ia the other clases of pot plantw. The Pompons were fively grown and abundantly flowered, the best coming from Mr. CHomlon, Mr. JAMEs Brown, Langfeld, Heaton Moor: and Mr. R. Hardwior, Woodley's Grange, Ashton-on-Mersey.

\section*{Cut Blooms.}

For forty-six incurved blooms, not fewer than eighteen varieties, and not more than two bloomy of one variety, X. BenRews, Kis.. Bettisfield Park, Whicchurch, was a long way let among nine competitors; ynd, Col. B. Ltozd, Aston Hall among nine
Shrewabury.
For twelve incurved, E. Behrews, Req., and Col, Lloyd respectively gained 1st and 2nd.
For twenty-fur varietiea, cut blooms, Japanese, Mr. Behrens was again let; and Mr. J. Stamming, Brosdfidd Leyland, 2ad.
For thirty-six miscellaneons cut blooms, let, J. Brockle BANK, Req.
Amongst the whole, we noted as the best incurved blooms Oharles Curtis, a finethowy primroee; J. Agate, a good white Mrs, Coleman, buff; J. B. Whitnall, dull maroon; Golden Emprese of India, a model flower; Priccess of Walos, pink; With white contre; Queen of England, blush; Elobart Cannell, bronze; John Lambert, blasis and orange-shadedvery pretty; Mrs. Kearn, one of the best, of a soft pink glowvery compact; Lord Rosebsry, purple-lilac; Miss M. Haggas, primiose; Wm. Tunnington, bronze, as compact as a cone; Mre, Robinson Key, yellow: Barom Hirsch, one of the best of the bronze type; C.B. Whitnall, purple, ahaded; Jeanne d'Or, flesh colour; Brocklegh, fine pale lilac.

Arang the best Japanese were Mrs. B. Ward, orange and yellow; Viviand Morel, of a pinkiah cast; Stanstead White, a really good flower, better than we have seen it this nemson Duke of York, crimson, and white at the back of the florets, one of the prettiest; H. L. Sunderbruck.I good, clear yellow; Ed. Molyneux, stıll a prominent bizarre; Mdlle. Thérese Rey. one of the most beautiful, white with yellowish cast; E. L. Jamieson, a good suby shader flower; R. G. Schwabe, a fne
showy flushed pink, with whit back forets; Internationsie. showy flushed pink, with whit back florete; Internationsie, liren, shaded orange and , roseate pirk; Mis. Bionshaded lijac, with orangeat the back of the florets : Mons Panchoucke a very fine flower; Silver King, pale crimeon, lwith the back of florets as if silvered; Primose League, beat of ite clase; E. W. Childs, mave; Niveum. good, clear white Louise, fine broad potal, and good generally.

\section*{ORCHIDS.}

The platform was filled with Orchids in great variety from HEaTH \& SOX, Chelteabam, comprising Cattleya labiata in great number', but nothing of first-class excellence amons them. Cattleya Mastersige \(X\), hybrid in which the blood of Harrisiz il largely intermixed, was good. There were quantities of Dendrobium Phalæaopsis, some very good Oncidium varicosum, some rather rare Cypripediums, the chief amongst them being an insigne Sandera with three flowers, the pale them being an insigne Sanderg with three flowers, the pale
yellow and the white being partinularly pleasiog, and yellow and the white being partinularly pleasiog, and amonget Palma and other ornamental plants, and made a picturesque dieplay.
Mr. James OyPEER, Cheltenham, had a lest pumerous but choice lot, in which a new Cypripedium, in the way of Lee anum eiganteum, but with a dorsal sepal broader and clearer than in that superb variety, was prominent; also one of the most striking of the Odontoglossum Cervantesii, or, rather, Humeanum aection, in which the whole of the segments were flushed, and the concentric rings and spota more than usually promisent. There were many good types of Dendrobium Phalenopsin, which is proving itself to be one of the very best novelties that has boen introduced for years for its great variety, and its usefulnese for indoor decorative purpoees.
Mr, G. B. Balis, Bowden, received First-class Oartificutes for Cypripedium ingigue sanders, with two well-daveloped large flowars-pity that the dorsal sepal is not altogether free of faint pinkish spote-st is uadoubtediy the best of the iavige division; also for Lycante, a natural hybrid, showing the lip and petale of Shinneri, with the narrowish bronze sepels of one of the forme of L. gigantes. Along with these wore several other good Cypripeds, and a white Lycaste Skinneri.

\section*{Miscellareous.}

Wm. Chibran a Son, Altrincham, had a very creditablo avertment of plants in variety, very effeotively groupsd
together. This collection of cool, hardy herbaceous, as well as together. This collection of cool, hardy herbaceous, as well as of Chrysanthemums of various types, and other flowers, was a showy one.
Mr. Jas. Broome sent a lot of posies of hardy herbaceous flowers grown in his garden at Landudno.
H. OAMELL \& Sons had a beantiful lot of double and aingle lowered Pelargoniums arranged in pyramidal bunchea, along with a few select Chryeanthemums.

Messre. LORD, Ashton-0n-Meraey, had a fine lot of cut sprays of various indoor fluwers which tell well in groups at this of various indoor of the year.
Diorson \& Bobrnson exhibited a fine collection of Cyclamens set out amongst Maidenhair Forns; and DICKson, BROWN \& TAIT had a similar assortment.
Mr. Johi Watkins, nurgeryman, Hexeford, put up a collection of over fifty dishes of dessert and culinary Apples in first-rate condition.

VARIORUM.

A Tropical Froq at Kew.-Dr, Ganther, writing to Nature, wy: A short time ago Mr. W. Wation, the ascistant carator of Kew Gardens, informed me that he had noticed for neveral jeara, in some of the hothoases, apecimens of a small frog, which, hiding away daring the day among the pots and orchid batkets, enlivened the quiet evenings with their shrill, whistling noter. Saspecting that this frog must be of foreign importation, I alked the director to allow some of the specimes to be canght, and some days ago I had the pleasure of receiving three specimens in excellent condition. The frog is Hylodes Martinicensis, a mall arboreal species, distribated over, and common in, many West Indian islands (Martinique, Porto Rico, St. Vincent, Dominica, Barbados, \&ce., and possibly in Trinidad). Mr. Watson recollects that he observed it first some ten years ago, that he lost night of it for some time, but that it reappeared about four or five years ago. Taking into consideration the few facts with which we are scquainted as to the reproduction of this frog, it neeme most probable that several specimens of both sexes were, on more than one ocisasion, zecidentally introduced in Wardean cases. However that may be, it is evident that the froga have freely propagated since their introduction. At present they are most numerona in the propagating houses, in which the temperature ranges between 80 deg. and 100 deg., sinking in winter at times to nearly 60 deg. Accompanying Mr. Watson one evening, I heard from several points the call of the frogs, which somewhat resembled the piping of a neatling bird; and guided by the sound, I had moon the pleasure of aeeing one of them clinging to the side of a glass case. There is nothing extraordinary in the accidental importation of individuals of a tropical apecies of frog into Earope; bat it is an interenting experience, that the apecies should have permanently established itnelf. This is owing, in the firat place, to the favourable conditions ander which it found itself placed, and secondly, to the pecaliar mode of its propagation. Hyloden Martinicensis, and probably the majority of its congeners, does not apawn in water, but deposits from fifteen to thirty ova on leaves in damp places. After a fortnight the young froga are hatched in a perfect form, having pased through the metamorphosis within the egg, thus eseaping the viciuitude and dangers to which they would have been exposed daring the progresu of the uanal Batrachian metamorphosis. This inatance of the acclimatination in Kow Gardens of the "Coqui" (as the frog is called in Porto Rico) is unique in Batrachian life at present. I truat that the little gueat may long flourish Whare it has found wuch a congenial home, and where it usefally aida in the destruction of plant-eating insects and wood-lice, of which I found great numbers in the stomach of a specimen. If at a later period a nest with opa were discovered, Mr. Dyer would delight the heart of embryologista, to whom the opportanity of examining fresh ova of this frog would be mont welcome.

\section*{Obituary.}

Lord de Tabley.-The deceased peer was generaily known as a acholarly and elegant poet. It is not so well known that an the Hon. Leicester Warren he wai a critical botanist of great acatenetes, as witness his inveatigations on the geaus Romex add many other British plants.

Richard Gilbert.-By the death, on Friday, Nov. 22, of Richard Gilbert, at the age of seventythree, the gardening world is the poorer by an excellent gardener, and a man of aterling wortb. The deceased had been gardener to the Marquis of Exeter, and during the last few yeara tenant of the kitchen garden and appartenances at Barghley Houso, Stamford, at which place he died. His connection with Barghley began in 1868, he having been recommended to the post of tead gardener by the Superintendent of the Royal Horticultaral Society's Gardens at Chiswick. Mr. Gilbert had the advantage of a varied experience in gardens and gardening, and had many changes of masters, before he settled to his life's-work at the place with which his name was to become intimately connected.
To those who may be interested in the matter, we would refer our readers to his autobiography, which appeared in these pages on Augast 14, 1875. Ho was an enthusiant in his profension, doing thoroughly, and with all his heart, whatever he undertook, but hi forte was fruit and vegetable calture, and out-ofdoors gardening generally. In few places coald better

trained and fraited wall-trees, or finer Strawberries, be found. His British Qaeens were unaurpassed for size and goodnenn, and although, as was natural in a man capable of having an opinion, about retaining what was beat in every sense in the older productions of the garden, he was constantly teating new varieties of fruit and vegetablen. We believe there was scarcely a new Strawberry brought out by Menirs. Laxton of Bedford, Mr. Lovell, Mr. Allan of Gunton Park, or other raiaer of note, that he did not at once bay and tent in the capital soil of Barghley. At one period, some ten yearm ago, he endeavoured to raise varietien of Sapoyn, and cronea between Cabbages and Broccolis, which were the one or the other according to the aeason at which they were cat; but these, although they found favour with gardeners for a time, are, at this date, not generally liked. With his Qaeen of Broccolis, and Universal Savoy, he wan more succeanful, and these are likely to survive for yeara to come. Hin Royal Sovereign Tomato, and Burghley Parik Cherry, are meritorious productions, as are Victory of Bath and Gilbert': Green-Fiesh Melon. Most of thene novelties were raised by him, and of the others he was simply the introducer.

Oae of his greatest feate as an exhibitor, and he exbibited mach and frequestly at the London and other big ahow, was the winning of the Carter

Challenge Cap, for a collection of regetables, at the Royal Horticultural Societp's nhow on July 7 , 1875, his chief opponent being Mr. Artell and Mr. Pragnell.

George Lawson.-The death has occurred, says the Athenceuin, at the age of vixty-teren years, of Profesaor George Lawson, who occapied the Chair of Chemiatry and Mineralogy in the University of Halifax, Nova Scotia. He mu a native of Dandee, and while engaged as a young man in a city office he devoted his leisare to veienco paranits, and in 1848 he left his native tom for Edinburgh as astistant to Prof, Balfour. In 1858 he was called to fill the Chair of Natural Hiwory at Kingston College, Canada, some yeare altermarda taking up his late position at Halifax. In 1888 ho was elected President of the Rogal Society of Canada. It is not too much to say that to Prof. Lawson muat be ascribed much of the ancem of tendant on frait-growing in the Dominion, tince be was the firat to direct attention to the ponsibilitier of Canada's development in this direction. He wu a Fellow of the Royal Phytical and Botanical Societies of Edinbargh, and of the Institute of Chemintry of Great Britain, and an honorary member of tho Edinburgh Geological and Scottioh Arboricaltanal Societies. He was also a Fellow of the Ropul Society of Canade. In the summer of lant your he visited Scotland, and in October last he retired from college work. looking forward to wellearned rest. On November 1, however, he wa seized with paralynis, and ten daya later pased amas. He was twice married, and his firat wife, Miss Lney Stapeley, of London, contribated to the Transactions of the Botanical Society of Canada a paper on "The Silkworm and other Fibre-yielding Insectu, and the growth of their Food Plants in Canada." Prof. Lawson was an old and valued correspondent of thit journal, and furnished un regularly with reporta on the Apple crops of Nova Scotia.

Mrs. Bruce Findlay.-It is with much reprel we announce the death of Mra. Bruce Findlay, wifo of the Carator of the Manchester Royal Botanical and Horticultaral Society, which occarred at 014 Trafford on Wednesday, November 20.

\section*{SEEDS.}

Lonnow: Nooenber 27.-Meosrs, John Bhaw a Sonf, Seed Merobants, of Great Mave Pond. Borough, London, B.IF. report to-day's market thinly attended. There has not this week been any noteworthy change in the value of either Clover or grass seeds. As yet no general inquiry of any importance has sprung up for aeeds, a few large provincial firms have, however, buen taking advantage of the low rates current to lay in some supply. Tares are neglected. Peas and Haricots show no alteration. Mustard and Rape seed keep firm. As regards Bird seeds there is no fresh feature.

STRATYORD, November 28.-Quotations:-Bruces, dark moil, 3ss. to 40 s : do., light, 40 s . to 60 s . Beading Giante, 40 s , to S5s.; Sutton's Abundaace, 50 s , to 70 s. pear ton.

FARALredow: Novamber 28.-Quotations: Main Orop Kid. neys, 80 s , to 90 s . J Jeannie Dasns, 70s, to 808. ; White Hebrons,
 Sutton's Abundance, 65s. to 75s, per ton.

London Averages: Now. 27. - Dunbars, 90s. to 100f.: Snowdrope, 60s, to 93s.; Hebroas, 60s, to 90s. : Sutton's Abundance, 60s. to 65s.; Puritans, 55s. to 60s. ; Regente, 60s. to 70 s ; Imperators, 40 s , to \(50 \%\); Magnums, 35 s . to 45 s , per ton.

\section*{HAY.}

Averaget.-The following are the averages of the prions at the metropolitan markets during the paet week:-Olover, prime, 80 s . to 100 s . : do., inferior, 50 s , to 70 s : hay, beet, 60 s . to 90 s . \({ }^{2} \mathrm{do}\), inferior. 86s. to 60 s . mixture, 70s. to 87s. 6d. ; and straw, 30s, to 44. per lond.

\section*{CORN.}

Averages. - Official statemont of the average prices of British Corn, imperial measure (qr.), for the week ending November 23, and for the corresponding period in the previous year:-1895: Wheat, 25s.7d.; Barley, 25s. 1 d. ; Oats, 14 s .4 d. 1894: Wheat, 19s.11d.; Bariey, 22s. 4d. ; Onts, 14s. 3 d.

[The term "accumulated temperature" indicat:s the aggre gate amoant, se well as the duration, of degreen of temperature above or below \(43^{\circ}\) Fahr. for the period named : and this combined result is expressed in Day degrees - a "Day-degree" signifying \(1^{\circ}\) continued for twenty-four hours, or any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first columo are the following: -

0, Scotland, N. Principal Wheat-producing Districts1, Ecotland, E.; 2, England, N.E.; 3, Kogland, E.; 4, Midland Counties; 5, Fagland, Ineluding London, 8 Principal Grazing, \&'c., Districts - 6, Scothand, W. ;
7, Kngland, N.W.; 8, England. B.W.; 9. Irehnd, N. 7, Rngland, N.W.; 8, England, S.W.; 9. Irelnad, N.; 10 Ireland, S. \#hannel Ialande.

\section*{THEPASTWEEK。}

THe following summary record of the weather throughout The British Ialands for the week ending November 23, is furnished from the Metearological Office:-
"The weather varied considerably in differeat parte the kingdom. Rain was of frequent occurrence excepting in the south-east, but the amounts were lese heary than those of the weeks immediately preceding. The air was very humid generally, and fog or mist were experienced at times.
"The temperature apan exceeded the mean, the exces ranging from \(4^{\circ}\) in "England, 5.W, and the Channel Islande,
to \(2^{\circ}\) is most of the weetern and northern districto. The highest of the maxima were reconded on the '17th at most of the English stations, but later in the week in Ireland and Scotland. They ranged from \(58^{\circ}\) in the 'Chanvel Islands,' and \(57^{\circ}\) in the south-west and south of our islands, to \(54^{\circ}\) in "Scotlased, W.' and 'Irelend, N.' The lowest of the minima were registered on the \(i 8 \mathrm{th}\), and varied from \(23^{\circ}\) in the Midlend Counties, to \(30^{\circ}\) in 'Scotland, N. and \(W_{\text {., ' an }}\) ' England, K.E. and N.W., and to \(38^{\circ}\) in the "Channel Islands.
"The rainfall slightly exceod \(d\) the mean in Ireland, and just equalled it in 'England, E. ; in all other districts there was a deficit.
"The bright sumshime was in excess of the mean for the time of year in most parte of the king dom. The percentage of the possible duration ranged from 33 in "Ireland, \(\mathbb{N}\)., to 19 in - England, S , and to 9 in 'Scotland, N.

Chrysantabmum Sport: J. W. V., Batnet. Tae bloom you send appears to be a sport from the variety you name, bat the colour, though diatinct from the type, is not very attractive. It may be well, however, to grow it as atrongly as possible next season, and exhibit blooms before the National Chryanthemum Society, when it true worth conld be more certainly determined.
Dendrobiom: F. W. M. Dendrobium Linawianam thrives in most collections as well as D. nobile when grown in the same manner. Bat in places where the proper resting searon in a cool and dry house is not atrictily observed the plants of D . Linawianum resent the neglect more than those of D. nobile. We recommend you to keep your apecimens in a cool, dry, bot light situation antil they atart into growth again and then gradually to take them into the warmeat and most bumid house jou have until the growthe are fully completed. We have no evidence of ite situation in its native habitat.
"Qarden Annual" amd "Horticultural Dirgc.
tory": W. \(E\). \(L\). You should apply to the editors of those periodicals. How can we tell?

Incandescent Gasliget in a Conembvatory: A.E.K. The fumes from gas, anlest completely consumed, are very idjarions to plant life, in proportion to the amount of salphar left in the gas. It is rarely that the gas is quite free from this deleterious nabutance.
Lilium losgiflorum var. Harrisif: \(L\). \(L\). B. The bloome are obtained at this seaton from longdelayed buibs, which may not have been potted till June or later, but grown ander natural cool treatment-except, perbapa, just before flowering, when they are placed in mild heat, so as to obtain well-expanded blossoms. These bulbs are selected from importation arriving late in the seatod, which are suitably retarded.
IVI: G. G. The grafting of the variegated forms on stocke of any atrong green variety can be bent undertaken when growth commences naturally; or, if you would hasten the operation, it may be done in a close moist pit or house having a maximum temperatare of \(65^{\circ}\) and minimam of \(55^{\circ}\), choosing the latter part of February or beginning of March. It would be better if the stock were one-year rooted in pote.
Mabiti Strawberbirs: A, \(\boldsymbol{K}, \boldsymbol{H}\). We give you the names of varieties of moderate price when purchased as young plants, viz., Noble (Laxton's), Vicomtesse Héricart du Thary, Sir Chas. Napier, and Elton Hine. Your method of cultivation is very suitable, bat we should be inclined to plant some of the early varietie in the warmer place, and the later in the colder aite.

Mushroom Spawa: A. B. C. We ahould imagine that he would be liable to an action for damages if he knowingly sold "spawn" that had lout it vitality, or which was incapable of producing Muahroom.
Musnпомм: \(F_{0}, B\). The withered brown appearance of the young Muahrooms pointe to pawnbrick: "having been emplojed in which the mycelium "spawn" had "run," and conetquently becume uneless; or to too great warmth in the bed.

Names of Fruits: E. Smith, Greenhaugh. Your Apple is Egg or White Paradive.-C. Kemp. Apple. Em* peror Alexander. - C. W.C. Apple, Golden Noble ; Pear, Josephine de Maliney.-C. Liddiard. Your
 Applea are unknown to us,-G. D.
Superfin: 2, Marie Louise; 3, Duchese d'Angouème. Apples, 1, Brymer; 2, Northern Spy; 3, not known.
Nawes of Plants: Correspondents not answered in this issue are requested to consult the next number. W. G. Ventnor. The Chrysanthemam bloom you rend is true Val d'Andorre, bat light in colour owing to an early bud having been selected, and to the unusual warmth during September. Such matter as theae should be addressed to the Editor. -D. L, Contich. 1. Oncidiam pretextum: 2, Oncidiam tigrinom; 3 and 4 . Oacidiam ungaiculatum; 100, a Pbyllocactus, posibly the eedling known as aurantiacus.-J. \(H\). Cheilanthes hirta. -W. M. M., Ross. 1. Liparie longipes; 2, Cymbidiam giganteum; 3, Bifrenaria inodors.-J. B. Maxillaria picta-D. J. 1, Fittonia Pearcei; 2, Gymnogramma ochracea; 3, Selaginella viticuloa; 4. Bambuaa gracilis; 5, Draceaa fragrans; 6, Dracmas rubra.
Odontoglossom Habryanem: F. H. M. The variety is diecinct in baving the sepal almort wholly of a dark chocolate colour. The original, like your plant, comes darker in mome years than others. Many thanks for promise to send a photograph.
Raspberry Plantina: F.J. F. If the cane are to be planted at wide distances and then bent over and secared to a stake 3 feet high placed midway between the stools, the atools or ciumps should not be leas than 6 feet apart if it be land on which the Raspberry grows vigorously, and 5 feet in other cases. If the Rapberries are to be secared to an espalier tence, then, plant at \(1 \frac{1}{2}\) feet apart. Do not put more than one plant in a bole.
Situation on a Tea or Sugar Plantation: W. B. Advertise in some of che colonial papers, or in the Tropical Agriculturist and aimilar trade papers.
Woodlice and Mushrooms: H. E. Clear away the hay now covering the beds, and pour boiling-water into the crevice, which are aure to be found between the bed and the walla-repeat thin twice a day; remove all materialf, stones, bricka, tlen, litter, \& ©., which could form hiding- places for the insects, and dash boiling-nater into all acceasible and Jikely biding-places. Cover the beds with bast matr, or clean straw; or leave them ancovered. Mushroom-beds do not need covering, unles the noil be very light, or mach fira-best is ased

\section*{RESULT}

Proves more than volumes of print. My Collection of Chrysanthemums has again succeeded in winning the President's Prize for Group of Plants, and the Gold Medal for Table of Exhibition Blooms, at the National Chrysanthemum Society's Show, November 5, 1805. In addition to many otber prizes my collection has now been awarded

\section*{6 GOLD MEDALS}
in two years-the highest award obtainable in each case. I have much pleasure in announcing that I have secured some Grand Leedlings from our two most noted and successful English raisers, Chas. E. Shea, Esq., and H. Briscoe-Ironside, Esq., which, together with my own Seedlings will form a collection

\section*{UNRIVALLED.}

My GENERAL GUIDE is now ready, with redaced prices for all last season's novelties, and contains the following Cultural Articles:-How to Grow Japanese for Exhibition; How to Grow Incurved for Exhibition; How to Grow Specimen Plants; How to Grow for Decoration; How to Dress Incarved for Exhibition; and How to Save Seed. A large number of Growers attribute their

\section*{SUCCESS}
to following the advive given in my Guide, which can be obtained, post-free, for eight stamps.
My LIST of NOVELTIES for 1896 will be ready in December.
H. J. JONES,

RYECROFT NURSERY, LEWISHAM, S.E.

\section*{WINTER DRESSING.}

4 Guaranteed to clear out Mealy Bug. Cleanse and prepare your Fruit Trees and Planta, both Scale, Bug. Red Spider. American Blight, aud the Larvo of other insects, by uning the

\section*{XL ALL LIQUID INSECTICIOE WASH}

A pare Nicotine Preparation (Patenter a new syatem), from duty. ree Tobacco. Absolutely sain, and no fear of injury to the Per Pint, 2s.; Quart, 3s. 6d.; \& Gallow, \(5 s_{\mathrm{o}}\); 1 Gallon, 10.

\section*{पY POSITIVE PROOF.}

Mr. E. HILL, The Gardows, Trong Purk, Tring, writas:NOF. 18, 1693. I annot speak too highly in favour of your XL ALL Liquid Insecticide (Wash), as a Wiater Dresaing for
Mealy Bup on Vines and Fig Trees. We gave it a trial last Mealy Bug on fines and Fig Trees. We gave it a trial las Cording to directions, it is perfectly aafe in the bands of a novice, and I am jumified in saying that for the purpose men
tioned it is the best remedy that has yet come under my tioned it
To be obtained from all Nurserymen, Soedsmen, Florists, and Sundriesmen: or, direct from
O. H. RICHARDS, Sole Proprietor, Old Shot Tower Whart Commercial Road, Lambeth, London, S.E.
Further Particnlars and Testimonials post-free on application.

NEW PEA,
"BOSTON UNRIVALLED."
A NEW, PERFECTLY DISTINCT, and VALUABLE ACQUISITION.
An unusually prolific, dwarf, wrinkled, Second Early Marrowfat, of the best table quality. Height, \(2 \frac{1}{2}\) to 3 feet; pods large, 5 to 6 inches in length, of the "Telephone" shape and colour, but more even in size than that well-known variety, there being from 9 to 11 fine peas in the pods. These mostly hang in pairs, literally covering the haulm, which is robust, and not subject to mildew.

A first-class Pea for either Private Gardens or Market Growers, and as an Exhibition variety must rank as a decided improvement and great acquisition in profitable Horticulture.

Retail, per Sealed Half-pint Packet, 1s. 6d.; per Sealed Pint Packet, 2s. 6d.
Trade Price and List of Testimonials on application.

GARDEN REQUISITES. COCOA-NUT FIBRE REFUSE,

ROSES.
THE National Rose Society has published a pamphlet entitled Hints on Planting Roses, oompiled by a committee appointed for the purpose. The work is intended for novices and amateurs, and is likely to be received by them with favour from the clearness and simplioity of the directions given.

The subjects treated of are the season when planting operations should be considered, the best time to order Roses, the best time to plant or replant them, the best method of effecting these operations, lists of Roses suitable for oultivation for various purposes. The following extracts will show the practioal nature of the little book, copies of which may be had at a cost of a few pence from the Secretaries of the National Rose Society, Rev. H. H. D'Umbrain, Westwell, Ashford, Kent; or E. Mawley, Esq., Rose Bank, Berlihamsted, Herts:-

\section*{How Roses ought to be Plantrd.}

Whenever it is possible, Roses should be given a bed to themselves, in an open spot, away from trees, and not planted among other flowers. A bed 3 feet wide will hold two rows of plants, and one 4 feet 6 inche wide, three rows. The distance between the plants for dwarfs should be about 18 inches, and for standards about 2 feet 6 inches. The beds having been made ready, and the position of the Roses in them marked out, the next thing, and the most important of all, is to see that they are properly planted. Some of the plants should be carefally removed from the trench where they had been " heeled in," and brought to the side of the bed they are intended to occupy. A mat should always be thrown over them, to keep their roots from drying by exposare to san or wind. A hole should then be dag about a foot square, and of safficient depth, in the case of dwarf (or "bush") Roses, to allow the junction of the stock and scion to be about an inch below the surface of the bed when the operstion is completed. In the case of standards the hole should be 6 inohes deep. A plant should then be taken from beneath the mat, sprinkled with water, and held with the left band in the oentre of the hole, while with the right the roots are spread out horizontally and evenly in it, taking care that the roots cross ewch other as little as possible. Some of the finest soil available should next be sprinkled over the roots so as just to cover them. Over this light covering place 3 inches more soil, which may then be trodden in and the hole filled up. Tread the soil firmly round the plant when this has been done. Firm planting is very necessary for the fature wellbeing of Roses.
In the case of heavy soils, or where the ground remsins for any leagth of time in too wet a coon-
dition for the planting of Roses to be satisfaotorily carried out, it is an excellent plan to secure some light gritty soil, such as the clippings obtained from the sides of roads when the grass-edges are being out. A spadeful of this ma'erial may then with advantage be placed both above and beneath the roots instead of the natural soil. Soil of this oharacter may be firmly trodden without oaking together, and the grit in it encourages the early formation of roots.
When planting Roses singly on lawns or elsewhere, the same method should be followed as whed inserting them in beds. Where Roses are planted in the spring the shoots should be pruned before planting.

\section*{Single Plants on Lawns or in Borders.}

Previous to planting Roses singly on lawns or in borders a hole should be dug for each, 18 inchen equare and 18 inches deep. The soil removed from the holes should be well mixed with one-fourth of its quantity of well-decayed manure, before being reatored to them. It the soil be found poor and ansuitable, better soil from another part of the garden or some tarfy loam should be mbatituted. No grase should be allowed to grow within at least 6 inches of the atem of Standard Rosen planted on lawns.

\section*{Climbing ob Pillar Roses.}

For Climbing and other Roses of very vigorous growth the bole prepared for their reception should be 2 feet quare and 2 feet deep, and care be taken that the soil be of a suitable character and well enriched with manure. For it mutt be borne in mind that such Roes require mach more root-room than those which are pruned back every year, and ia most casel are intended to occupy the same ponition for many yeara to come. Therefore, any extra care and attention bentowed on the planting of strong-growing Rones, like those referred to, will, nonen or later, be well repaid.

\section*{Staking Standard Roses.}

As the planting proceeds, each plant should be secared to a firm atake of some kind. In order to avoid damaging any of the roots, the atake thould be driven firmly into the holes prepared for the reception of the plant before planting them. Dwarf of bash-plante do not need staking; bat, to prevent injary from high winds, all long growthe should be thortened previous to planting,

\section*{The Labrlling of Roses.}

Where there is only one plant of aby varisty, a parmanent label, with the name of the R 3e either written or printed upon it, should be attached to a amall atake placed near it, and not to any part of the plant itself; but when everal plants of the same variety are grouped together, or follow one enother, labols will only be neceasary at the begianing of each sach groap or row.

\section*{The Winter Protection on Dwarf Teas and Norsettes,}

All kinds of Reses should be planted in the way previounly dencribed. Teas and Noisettes and other tender sorts, however, require after planting some protection to be given teem, or they will be liable to injary thould an unually eevere frost afterward set in. Fortunately, Iwarf plant may be readily protected by drawing the wil over the centre or crown of them to the height of 3 or 4 inches. This will be found an excellent methcd, for, except in ex'reme cases, the plants are in this way saved from zerious damage, although the exposed portion of their ahoote may be deatroyed. If further protection be required, bracken or atraw may be placed loosely among them.
Ten Wixter Phomerion of Stakdard Trupes ayd Norsertes.
Ia most winters the insertion of bracken in the beade of Siandard Rowen, or tying their shoots to a secare central atake, and thatching them with atraw or branken, will be found to answer excellently.

\section*{Orchid Notes and Gleanings.}

\section*{ORCHIDS AT CAMBRIDGE LODGE, CAMBERWELL. \\ The collection of R. I. Measuren, Eiq., Cambridge} Lodge, Flodden Road, Camberwell, is rich in Cypripediums, and eapecially in the rare hybride, many of which have been raised on that place; and mach attention wat given to the crossing of C. bellatulam and othera like it, the reanlte being in some cases very fine, although many of these crosses have not as yet flowered. It show the adaptability of Orchide when properly managed, and peak much for the akill and attention given them by Mr. Chapman, the gardener. The hybrids of the niveum section of Cypripedium are not the eaviest to manage even in pure country air, much lets at Cambridge Lodge, which in, in fact, in London.

Two beantiful forms, now in flower, are C. \(x\) Annie Measares (bellatulum \(\times\) Dayanum), and C. \(\times\) Cbas, Richman (bellatulum \(\times\) barbatum), the latter now bearing a aecond inflorescence which, like that of the preceding one, is two-flowered. Other plant in bloom in good specimen were C. \(\times\) Leeanum Masereelianum, a very fine variety; C. tonsum auperbum with nine flowern, C. \(\times\) Statterianam, C. \(\times\) orphanum, C. \(\times\) T. B Haywood, C. \(\times\) regale, a pretty tinted flower; C. \(\times\) Ameaiana, C. callosum, the noble C. \(\times\) Allenianam aporbam, C. \(\times\) Carrierii, C. \(\times\) marmorophyllam, C. Charlesworthii, C. \(X\) Arthurianum. A great number of large specimens of C. inaigne were remarked fatt coming into lower ; the beat of those that were expanded being the clear yellow C. insigne Sanderæ, and the richly parpleapotted C. i. Cambridge Lodge variety, which among other characteristica has the flower bract atriped with purple.

One of the Cattleya-houres was filled with glowing plants of Cattloya labiata, carrying hundreda of flowers. The floriferounens of these plants will be understood, some of the plants in 9 inch baskets or amall pots carrying ten to fourteen flower eacb. The dark coloure predominate ae usarl, but the most prized is the white C. labiata R I. Meseuren' variety, which possesses no other tint than a delicate veining of pink on the lip, which only eerva to heizhten the attractivenens of the flower. Cittleya Hardyana and C . Bowringians add greatly to the diaplay.

The genus Masdevallia forms another featare of this collection, two houses now being uet apart for these planta, in which at present many aingularlooking botanical epecies are in flower, together with interesting Pleurothallis. The showy species of the former will not come into bloom till next apring and later. In other houses, an extensive collection of Vandes in splendid condition was noted; equally good Cgmbidiams, containing all of the apeciea, even the rare C. Traceyanum.

In one houve were Lalis parpurata and L. elegans in aplendid condition; in another warm-hoase the Phalænopais were flourishing, and everywhere there wat evidence of a keen intereat being taken in the various plante.

Saccolabivm ampullaceum, Lindley.
"Baing of dwart habit, it may be advantageoualy treated in baskets or teak cylisder, hanging from the roof, and thrives well under a regular temperatare of \(18^{\circ}\) to \(22^{\circ} \mathrm{C}\)., in a very bright and moist atmosphere. It requirea acarcely any ahadiag, as it leaves are thick and leathery, bat in ammer the hamidity of the house matt be maintained to near the saturation point, and the compont kept always alive and moist." Linderia, t. 1585.

\section*{Cattligas at Larege.}

Daring the present and last week or two there have been flowering in the Cattleya-house at Lieken many plants of Cattleya labiata carrying nearly 600 . flowers: and on one plant alone there were forty-two flowers fully open. This is a gorgeous Cattleya, free-flowering, and very easy to grow, and therefore canuot be too highly recommended, when flowern at this seaton are prizod. It is, moreover, very various in ita colouring, Laeken, Decomber 1.

Orchids at Castle Hili, Englafield Gruix. The renidence of George C. Raphael, Etq., is arp. rounded by a pleasant garden and pleasare-ground, in a part of which a commodions blect of hounea, convenient of access, is devoted to Orchid caltare, which seem to give more than the usual proportion of flowers at all seasons. On the occation of a recent visit, the Cattleya- houre way gay with flown of Cattleya labiata, nambering aboat 100 spiken in various stages. Among them there was much nriets, and some of the dark forms, of which C. labiate Raphael's var., is the bent, were very attructive, acarcely two plants bearing flowers exactly alike in colour or marking, and although popalar fance favours the dark varietien, the lighter ones are, in their way, equally beautifal. Arraaged in the house with these plante were some Cattlejasareasad C. Bowringians; a pretty plant of the fragract old Epidendram ciliare, Cymbidiam gigantem, Letin autumasalie atrorabena; the noble Vanda cesalea, Raphael's variety, with large, almost circular fowen, netted with violet; and fine varieties of Lelia anceps in bud.

In one of the warm-houses, Phalmaopnis thrive admirably, which is more than can be asid of thom in many collections. Some plante of P. violaces and P. rosea were in bloom, and othern showing for flower. In another house, in which a large plant of Mam Cavendishii bears a heavy bunch of fruits, and tho handsome M. coccinea is in bloom, were in flower Dendrobiam saperbiens and its variety, Goldiel; D. Dasrei, and some very fine D. formorum giganteam. At one end of the house, a noble ape cimen of Nephrolepis exaltata, some 8 feet acrom, was suapended from the roof; and Dendrobium D \(\downarrow\). houseianum had made many new growthe more them 6 feet in length; here also the plants of Ealophiella Elisabethe grow and flower vigorounly, and Cœlogyus pandurata had eight epiken of ite handsome emeraldo green and black flowers.
In another house there was a fine show of Dendrobium Phalenopais Schroderiana, of which Mr. Adauh, the gardener, is justly proud. The fine apraye of variously-tinted flowers arching over from either aide made a charming display; and not only are the plants grown to perfection, but the selection him been a happy one, for smong them are a lary number of au perb varietien, both light and dark.
Flowering in the Cypripediam-house were good pieces of C. Spicerianam, C. Charleaworthi, C. \(\times\) Io superbum, C. \(\times\) Leeanum, C. tonanm, C. \(\times\) Arthuro ianum, \&c., and in the other houses, among otber things, some good Cochliods valcanica, Plete lagenaria, \(P\). Wallichiana, Oncidium tigrinum, the aingular and pretty Zigopetalum Barkei, Aruadia Bamburefolia, Sopronitis, Odontoglosami, \&c.

\section*{Cattleya Bowringiana.}

Your correspondent, W. Dawer, in last wolk Gardeners' Chromicle, alks-"What it the grestat number of flowers known on a spiks of this apecial of Cattleya?" We had a plant recently in bloom in a 14-inch pot with six spikes (which I extibited at the Tunbridge Wella Show), one with ninatand one eighteen, two eventeen, one fifteen, one fourteen, flowers, on a spike. This is greatent number of flowera I have ever had 01 spike, although we have had the asme plant for them ten years. Perhaps ome of your correuposia will asy what their experience in with this appect Charles Earl, Somerhill.

\section*{NOTES FROM OAKWOOD.}

Liliom \(\Delta u r a t u m\) was enpecially fine in the nthe damp toil in the wood, and poor in the drier soil of the hill, owing to the hot dry weather. I thin is Ealaliar are not enough grown. A good clawe alway: a pretty object, and when antamn frown fors the flowers that are out, Ealalias atill ahow woll fot " time; besides the gracefal leaves, the flowers whin very pretty winter decoration. I bought anme from Japan, not knowing what plant prodaced sam till our Ealalia zabrina bloomed. This has fowne very woll this season, sad E. gracillims or aniry tre has had a few lowers with as for the first Ibliem Ealalis japonica variegata has not flowered. Iblied E. zebrina is the only one which can be relied o
for flowers. The tharp froste cut the Liquidambar a little, the leaves are beautiful, bat not quite up to the usual colour. Aponogeton dietachyon is flowering well. We have many Primromes and Gentianellaa in bloom. Iris Vartani han been beautiful. Gaulcheria procumbens clothing the niden of ditchen and

NEW TEA ROSE ENCHANTRESS.
It has long been difficult to obtain good Rose blooms under glas during the dull weather of the late autumn and early winter monthe, before the forcea bloome are available, and for thin purpose
crop of young bude in various atages of development, promising to unfold durisg the winter monthe. Enchantress is the result of a cross between a Teaacented and a Chinene Boes; the bloomare creamywhite with deeper centrer, inclining to the globular ahape, and produced in great abuadance on the plante.

-
on bank in full sun in alwaya pretty, the red fruit taking the place of fiowerm. The North American Cranberry, Oxycoccus macrocarpa, at the ide of a pond makee a pretty carpet, and hat fraited very freely. The frait in excellent atewed and in tartaI think better, from being frember, than the Ranian Cranberrien. George F. Wilson,
M. ars. Wm. Paul \& Son's new varicty Enchantreas, for which they obtaiped an Award of Merit at the recent meetiog of the Royal Horticultaral Society, is particalarly valuable, as the plants exhibited were covered with large numbers of fine cream-coloured blossoms possesing all the desired qualities of sizs, fulnent and fragrance; there was also a plentiful

In acdition to ite value as a late blooming variety ir. doors it is a fine bedding Rose, for throughout the sammer and early autumn, plante growing out-ol-doort in the Waltham Cross nuraeries were covered with a profusion of most beautiful flowera, which continged anfolding until the evere front of lat Oc:ober so suddenly put an ead to all outdcor Roses.

\section*{FRUIT GROWING FOR SMALL GARDENS.*}
\[
\text { (Continued from } p, 612 . \text { ) }
\]

Prams.-We next come to Pear. These are not auch certain croppers as Apples, and during wet summers lowe a great deal of their flavour, and do not keep so well; however, when they are good there is no fruit to beat them, and they whould therefore be grown, but in amaller proportions than Apples, where room is scarce. There in no really good Pear worth growing for July and Aqgust; Jargonelle is perhap the best, bat it is very difficalt to get it just right, as it goes aleepy without warning, and for that reason is not to be recommended. [Gather it ere it is quite ripe, and keep in a cool room for a day or two. Eid.] September, Willisma' Bon Chiétien; October, Louise Bonne de Jersey (Fondante d'Automne) \(\dagger\); for November, Marie Louise (d. s.) (Emile \(d^{\prime}\) Hepat); November to Dscember, Doyenné da Comice; January to March, Dachesse de Bordeaux; February to April, Josephine de Malines. Nearly all Pears will do for atewing before they are ripe, and wiadfalle come in very handy for this parpose; but a very valuable Pear, grown exclusively for baking, and ready from December to March, is Catillac.

Late-keoping fruit must always be left hanging on the trees an long as possible, a it will then keep better, be more fally flavoured, and should not be picked until it readily parts from the tree, except in places exposed to high winds ; in many instances a greater portion of the leaves will have fallen before the fruit is ready for gathering, and this should only be done during fine bright weather, with as little handling as posible. A large number of fruitm noon ahrivel, and often do not keep through being picked directly a few premature windfalls occur (which are invariably worm-eaten), instead of being left on the tree.

Sound fruit whould be atored in a dark place, free from frost, and well ventilated, on slotted shelves, easily accesnible; and care should be taken not to mix any diseased or bruised fruit with it.

\section*{Plums and Chiraries.}

We will next turn our attention to Plum: and Cherries, about which little need be said, as the cultivation suitable for Applen and Pears is equally anitable for these. They are usually grown ay trained treen against a wall or fence, where they aucceed well, and are easily protected from birds ; they will do equally well as pyramids, where they can also be well protected from birds by the use of the garden-webber, which will be found very handy for Carrante as well; black cotton is better than white, as the birds are unable to nee it until they become entangled, and are therefore much more frightened.

The following varietien of Plums are good, conetant bearers: end of Jaly and beginning of Aggat, Rivern' Early Prolitic, a deep parple; Augut, Denniston's Saperb Gage, greenish-yellow; September, Victoria, bright red on anny aide, and yellow on the other ; October, Coe' Golden Drop, light yellow, with dark red apotu. Gather ripe fruit of Coe's Golden Drop Plum, wrap them separately in tiasue paper a week afterwards, and atore in a niagle layer in a cool, dry room. Fruit treated thus will keep autil Chriatmas. Probably the bent all-round Plam is the Victoria, of which euch large quantities are annually brought into the market. It usually bears very abundantly, and should therefore be thinned thortly after the fruita are formed, and later on, when nearly fully formed, can be again thinned, and used for preserving, bottling whole, cooking, or stewing; the remaining ones on the tree will then grow to a good mize, and make aplendid dessert fruit.
The following Cherries ape good bearers, and wellflavoured aorte: ond of Jane, Early Rivere, black:

\footnotetext{
* Extracte from a Faper read before the Streatham Hill Agaseiz Soclety, on Oct. 25, 1893, by M1. J. C. Waltham. Those in pxientheses give a more oxtendel list of goot
}
beginning of Jaly, May Dake, dark red; middle to end of Jaly, Bigarreau, red on sunny side, yellow on shaded nide ; Augast and Soptember, Morello, dark red, but this is only aitable for calinary purposes and Cherry-brandy. If only one is grown, choose May Dake.

\section*{Gooseberries}
require somewhat aimilar treatment as to planting and praning, and are uaually grown in the shape of a bush, and are not unfrequently allowed to grow into a tangled thicket, making it very difficalt to pick the frait, which is then very mall and not fully flavoured. A general rule to be followed when proning, is to allow a clear \(6 \cdot\) inch space between each branch, and if praned in the aummer, it will make it far easier to decide which shoots to leave and which to cut back, as a tree looks very different when covered with leaven than when denaded. They are easily raised from cuttings. These should be firm, hard, and free from pith, about 15 to 18 inches long, from which every bud and apine must be picked off for about 12 to 14 inches of its length, so that 4 to 5 incher can be inserted in the ground, leaving a traight stem of 9 to 12 inches high; the cutting is pruned back to about four or five eyes above this to form the brancher. When these have grown about a foot, they hould be shortened about 9 inches to prevent them from drooping and eventually touching the ground. The fature praning hould be carried out on precisely the same lines as already explained with Apples and Pears, except that when a strong vigorous growth forms in some convenient part, it can be left with advantage, and the old original branch next it can be cut entirely away-provided, of courae, it does not crowd the bush. They can be planted about \(2 \frac{1}{3}\) feet apart while young, and when they touch each other, the intermediate ones abould be dug up and replanted elsewhere, 5 to 6 feet apart. They are also grown in the form of a three-prong toasting-fork, either against a wall or wire fence, where they take up but little room and bear remarkably well. They should be planted 18 to 20 inches apart, so that each branch is 6 inches from its neighbour. If the young wood made during the year is under a foot long, the buehen require manuring when the fruit is setting next spring, but not otherwise.

Gooseberrien are often infeated with caterpillarn, which if not checked, will seriously injare the tree. They may be got rid of by dusting the treen all over and under with lime after a heavy dew; thim hould be repeated two or three times. [Shaking them off on to calico theets is effectual. Ed.] Sparrows and finches also attack the bads in spring, bat the use of the garden-webber will soon prevent their depredation. The beat kind to grow are, Whitemith, white; Early Sulphur, yellow; Keepaske, green; Warrington, red-this is a good variety for training gridiron fashion; Red Champagne is the fullent flavoured for desmert, bat it doan not bear quite so freely as Warrington.

\section*{Red Currants}
are uaually grown in the bush form, but the beat ahape is probably for the head to form a cap, atanding on a stem about 9 inches from the ground with branches about 6 inches apart, and when once formed they give no further trouble, as no fresh growthe are allowed to form, every one being cat back to two eyes when they appear, and if the branchen have never been allowed to grow more than 1 foot a year, the buds will develop all the way ap, from which clatters of Currants will hang. Seven branches will unally be found afficient, and when from 4 to 5 feet long they should not be allowed to grow any more; that, in foar or five year time, the tree will be fally grown. At the bude are a taty morsel for the finches in the spring, they should be protecter, otherwise one hav to moarn the absence of fruit, and the trees are reduced in bearing propertien for the next year or two. Under these circumatancen, it is better to portpone the autume praning till late spring, as the birds will then take the buds on the
new growthe, which are to be cut back in prefernem to those which are retained at their base, \(\mathbf{A}\) rery handy form which is sometimes adopted, is to grom the tree in the form of a miniatare atandard, with a stem 3 to 4 feet high, and a head as above deacribed; Strawberries and vegetables can then be grow underneath. Manuring and cultivation are the nme as for Gooneberrien. Red Datch in the betf for either bushes or atandards, and White Datch is the best white sort, of which one bush will unally bo found sufficient.

\section*{Black Currants.}

There in no easier fruit to grow than tho Black Currant, which require no training or thaking whatever. Ualike all other buahe that haro beod described, suckers are induced to grow up from the roots every year, at the fineat fruit in borne on the young wood; the older and weaker wood is cas ook no soon as the fruit is gathered, to allow the tree to confine its energy to producing healthy new thooth, which should be left about 5 or 6 inches apart.

The earth around Carrant-bushes and Raspberris should never be dag up, an they produce fibrose rootu, but elighfly picked up with a fork and manared every year with a top-dreasing, which also protects the rootl which are near the surface from injary from frost, and from becoming dry during aummer.

Black-fly often attacks the point of the new shoots, caraing the leave to curl up, and the Carrant bad-mite is sometimen very destractive, The easiest method to get rid of them both is to culs them off and burn them. Black Champion and Lee's Prolific are the beat varietien to grow.

\section*{Raspberries.}

If one part of a garden is moister than another Raspberrie will do better there than elsewhere, a they require a good deal of moistare, and the noil should be thoroughly good for at least 18 inchen deep, to enuure strong canea and large fruit. After planting in the autumn, the canes should be cat down to about 9 inchen from the ground to induce them to make good-sizad roota, and thus lay the foundation for atrong, healthy atools; if thir in ant done, however strong the caner may be, all the energy is expended in prodacing frait, with the reault that the next-year canes will be thin and weakly, and the atools rained. When the mooll are well established, from aix to seven of the atrongent canem should be allowed to grow each jour, and the remainder, together with the old canes, whet fruiting is over, should be cut right down; all grow. ing rooted suckern-of which a large number grow every year-should be pulled up, and if planted again, they will form new etool. In the autamn, tie them securely to a stake, reduce the two oataide ones to 15 inches from the ground, two of the others about 30 inches, and the remainder about 4 to 5 fot ; fruit will then be produced the whole way up the buah.
When planted to form rows, two lines of wire os lath should be run 2 and 4 feet from the ground reapectively, and the alternate canes reduced to sbout 2 feet, and the other about 4 feet 6 inches to 5 feet; the atools should be 6 incher apart, and tho row from 4 to 5 feet, according to the height tho canes are left. There are nome short standing kinds which do not require atakes, and are uually gront extensively for market purposen, Carter's Prolific being the best for this purpose; Superlative ir, holl ever, the beat of all, but requiren takes. The Strawberry is the last fruit I propose to deal with this evening, for, although Peaches, Nectarinel, and Apricots should, perhaps, have been incladed, they require apecial walls, localities, and treatmexh which excluder them from general cultivation if mall gardens, and are, in fact, far better growa is cool orchard-houte.

\section*{Strawberbies,}
like all other plente, require to be carefully planted. It is no use making a hole with e dibbor, forcing the roote in, and treading the earth in on top of them like 0 many Cabbage-plants, and thell expect them to grow when probsbly two-thind
have their head covered up，and the remainder half out of the earth．Separate holes must be dug， the root well spread out all roand，and the earth gently，bat firmly，preseed down all round，if we want to procure the atrongeat and healthieat plante， which at the same time meanalarge fruit．
They reproduce themselve by runners．The earlient of these，when required to form new plants， ehould be pegged down firmly to the groand，bat better atill on to the anderside of newly－cat tarf without Couch，or into small pote containing rich oil，when they will be ready for planting out daring Auguat，and commeace bearing fruit the following year．They ahould be planted about \(1 \frac{1}{2}\) to 2 feet apart．The runners that are not required should be cut off an they appoar，as they weaken the plante．

As the beds only last in good condition four or five yeart，otherm thould be planted permanently in another part of the garden to take their place when it is seen that the old ones are giving out．

Daring the firt crisp frost in autumn，all runners and rubbish having been cleared away noms time previously，and the ground between the rowa lightly pointed over with a fork，turning in a little short manure（deep digging with the apade being injo－ rious），cover the ground 2 or 3 inchen thick with partially－decayed manure containing a good amount of atable dung．This must not be packed closely around the plants；it will be washed by the winter rains and be perfectly weet by the apring，forming a close clean cuahion for the fruit to reat upon．

The malch also prevents the eacape of moisture from the earth br evaporation，which is retained for the apport of the planta and crops－a most im－ portant point in dry，hot weather．It also asves the trouble of putting clean atraw under the trusse of fruit，which is lisble to be injured by the process， and prevents the untidy appearance caused by the straw blowing about the garden．

The bent kinda to grow are：early－Noble，or Keen＇Seedling；medium－Sir Joseph Paxton； late－Lateat of All，or Waterloo．

As well－rooted and well－grown varieties of frait treen，true to name，cont no more to buy and culti－ vate than do those of an inferior kind，it is essential that they hould be procared from growers of repate．

When a plot of ground is to be set out with treen it is better to commence planting the centre with the late－keeping kinds of fruit，no at enable the early kind and those that are gathered direct off the tree，to be as near the pathe as ponsible when they are easily acceasible during any kind of weather， and the ground in not so mach trampled upon as when planted in the centre．

All trees，at they com 3 from the nurwerymen，have label attached，which soon rot or become illegible， and as a great deal of the interest is then lont， permanent labels nhould be attached as moon as ponible．The mont aitable kind can be pro－ cared of Mr．John Smith，Royal Label Factory， Stratford－on－A ron．
Usoal Distances for Planting Gabden Frutt Trres and Buthrs．
Apples，pyramide or buehes on Crab， 6 to 12 ft ．apart． Paradize（clong－ pruned）， 3 to 5 feet apart．
u）expaliers，horizontally－trained， 15 feet apart．
＂cordons，same as Pears．
，gridirons， 8 feet apart．

\section*{INDIA．}

MADRAS．
The Proceedings of the Agri－Eorticultural Society of Madras for April to June，1895，include reporth of the proceedinga，notes on Araucaria need，Euryale ferox，and Liberian Coffee，the Jast two items being of especial interest．

The Superintendent of the Baroda State Gabdens．
Mr．J．M．Henry，the former Saperintendent of the State Gardens，who，after serving about twelve years in the presidencies of Madras and Bengal，and sixteen yeari in Baroda，closed his Indian career lately，and left for Eogland to atart in buinean with bia son．

Coming from the Royal Gardens，at Kevr，in 1867， Mr．Henry was one of the oldent Kewite in India， He was，both as a gardener and a companion，highly eateemed and reapected by all hin numerous friends，

\footnotetext{
＊The paper was illustrated with practical demonstrations of the various methods of grafting，samples of well and badly－ grown branchee，besides a good collection of the abore－named truit．
}
and everybody heartily joined in aubscribing to a present conafiting of a very fine breakfant glas set， in a nilver frame．

Many of hir gentlemen friend met at a dinner－ party，when in the courne of a apeech proposing the health of Mr．Henry，and wishing him Gos－speed， Professor Littledalo aid：－＂As regards his work es Saperintendent of the Gardena，I may say，that although the extraordiaary development of gardeuing in Baroda，uader His Highnesa，has necessitated the calling－in of other trained professionale to astiat in the work，wo cannot forgat that it was chiely Mr． Henry who traced the original lines upon which he and others have aince been working with auch good tavte and marked effect．Mr．Heary will not onily be miased horticulturally，but also socially．He has kept up a very popular gymkhana for years，and his hoase has been an ever－open resort for his troops of frieads． When he goes he will not leave a single enemy behind him at Baroda，but all of us who remain here will remember him with love．＇
Mr．Heary，in reply，anid ：－＂When I arrived here in November，1879，the park was oo only in name． By the generosity of the Maharajah it is now aecond to none in India，Makarpara was a wildernens which took you half a day to reach，by reason of the badness of the roads．Now you may reach it in twenty minates with a fairly good horse and trap．When you do，what a paradise！All the old dilapidated dwellings，with which it was the rale to eurround palaces in olden times，cleared away；in their place， green lawns，floarishing Palms，and flowering plante． Laxmi Velas in a new palace，the foundation of which was laid shortly after my arrival．It tower，domen， and minarete are landmarks for miles－＇bonomed high mid tufted trees＇in a magnificent garden and park of about 1000 acres．Umrat，our seaside resort，in a natural gem or oasia in a wilderneas of mand，beau－ tified and made a royal reaidence by the ame hand． Time fails to enumerate all the improvemente done and proposed to be done at Umrat，but a few more of the mont important I will mention．The anad that surrouad Ucarat at a wildernese are to be planted with Cocos－nuts，and also all the cea coast for miles，now a sands denert．The arid plainn and dry hill－top of the Kadi dietrict are to be reforeated． Roadeide treen are being planted in every district， where the heavy－laden and weary may lie down and reat．Plans and entimates are in course of prepara－ tion for gardens and park for every town of any aize in the whole of the Maharajah＇s domain，beginning with those with \＆population of 15000 or upwards． For every State bungalow now bailt，the eatimate containg an item for the formation of a garden．I trust my accensor，Mr，Krumbeige，may be given the atrength and the leagth of life to see the fruite of his labour．＇

\section*{THE DORMANT PERIOD IN PLANTS．}

A frorrfol caune of failare in the cultivation of exotic plant is dus to ignorance of the climalal condition uader which the plante grow in the land of their origin，and eapecially the proper meason for reating．In temperate climen，where the winter and sammer are pretty clearly defined，deciduous plants diacard their foliage as the year＇s temperature declines，and appear during the winter either as leaflest objects or inconspicuous collections of dormant bads more or less hidden by the soil．Ever－ green plants，on the other hand，retain their foliage till the spring，but only，at it were，on sufferance， active growth ceasing almost entirely，and the verdure only persisting by its owa iaherent toughnese．This is easily seen by our familiar Christmas decorations， where the Holly，Ivg，Laurelg，\＆ce，last green for weeks anleas placed in hot，dry rooms，where they periah by desiccation．
The renting period in these cstes in clear enough， but it is another matter altogetber when we import plants from tropical and anb－tropical regiont，where the difference between the seasons may be very amall indeed an regarde range of temperatare，and altogether dependent apon widely varying conditions of drought
and moistare, so that instead of haviog a warm and cold season, with a fairly evenly distributed rainfall throughout the jear, we have a wet and dry season, with a constant high temperature. Under such conditions, we naturally find indigenous plants to be very differently constituted to ours, being fitted at once to withatand exceasive drought and heat during their renting period, and to aasame active development at short notice immediately the rains begin.
Now, these periods of drought and moisturevary conviderably on different parta of the earth's surface, and the native plants adapt themelves in conformity to it. Nor is this merely a case of latitude and longitade ; for if it were, the matter would be comparatively oimple, and the native country of a plant would determine its needs within certain fairly-defined limit. Elevation above the nea-level is, however, a most potent factor to be dealt with, and if ignored, leads to many mistakea being made in the methode of cultivation paraued. In the tropice we may by ancending the loftiest mountains, past through every grade of climate from the hot plaint of the ea-level, with an average mean temperature of \(80^{\circ}\) or 10 , to the region of perpetual snow where only the hardent alpine aurvive. Yet, deopite this obvioua fact, many a plant has been collected, and safely transmitted from high, cool regions in the tropics, only to die in a warm atove, where they have been placed because they came from the tropic, where a high temperature bas been presumed to be universal. In several cases, presumably dead plants of this category have been thrown to the rubbith-heap, only to astonish their owner by braving the elements, and obtaining a new leaue by their accidental exponare to conditions more congenial to their needs.
A curious feature in this connection is the great fastidiousnest of some planta, which will only thrive if their natural condition be very clonely imitated, and the cosmopolitan tastes of othere which will stand most diverse treatment with impunity. Oar native Atpleniam marinam, for inatarce, which thrives on our western cossts, where it mast occasionally be sabjected to some frosta, revels in a hothouse treatment, and becomes a hage and much robuster plant. Sach wide adaptability is, however, the exception, hence it is of great importance to the gardener to know something of the native natural conditions of growth, temperature, and hamidity, and above all, when ind how the plant asaumes ita dormant state, and for how long it maintains it. With plants which are to be forced into flower it is essential to withdraw them from all disturbing influences, and knowing when the dormant period is due, to lead up to it by reducing hest or moistare as the case may be, and maintaining them under auch conditions until it is desired to start them into growth. Then the application of heat and moistare will be followed by a healthy vigorou growth, accompanied by an immunity from vermin, the presence of which is only too often an indication of a previous too short sleep, and consequent weaknena.
The period of reat seeme, as we have indicated, to be determined mainly by the nature of the seasonal changes to which the plants are aubjected in their native habitata, but in some caese it appeart to be independent of this. The balbe of Hyacintha, Talipt, and other apring-flowering plante are bays daring the winter in forming their roote and even their leaven whenever not actually frozen up, and quite early in the year, little later indeed than many other plants that are beginning active growth, and long before the ann has attained very great power, they have flowered and formed new balbe, their foliage has died down, and they lie in the dormant atate for many montha, only awakening when winter has agnin net in. This neema a very atrange provision of nature that a bulb ahould resiat all the vivifying influences of summer ann and shower, and wake up into active life when the aoil is at or below freezing-point, and the great balk of vegetation dead or sali ep. It would be interesting to know how these baibe would behave if shipped direct to the Antipodes in the apring. In thors
cases where 'the cycle of life has been fally completed, and the whole vitality of the flower is compreased within the rootlen bulb, it seem: feasible that if they could be at once aubjected to their normal growing conditione, they could hardly be weakened by loning their rest; though, on the other hand, it must be assumed that some sabtle recaperative process is going on in resting plants akin to that which renews animal vigour during sleep, or otherwise the shortening of the period of rest could hardly be so detrimental an it is, even when favourable conditions for growth accompany the reawakening.

With regard to Antipodean plants which have long been introduced into this country, wach as the New Zealand Todean superba and pellucida, they have fully adapted themelves to our climate, and rise in our early spring at preciely the time when at home their growth would be ceasing. How long, however, anch a change take to establish, we do not know. Amongst our native Ferns we have noted a certain obatinacy in retaining the home periods of awakening deciduous Athyria found in Scotland, atarting into growth a week or two later than southern finds even after years of calture under like conditions. Polypodium vulgare, enpecially in its varietal forma, demands, curionals enough, a mach longer period of rest, or rather atart into growth under glase very much later than normal planta in native habitats. They often, indeed, nhow no trace of atarting under glass until July or even Anguat, and this with perfectly cold cuitare, so that the lateness of their atarting is not to be attributed to growth annaturally maintained by warmth long after the normal dormant period should begin. This case in anique in our experience, caltare under glans inducing, as a rule, and as one would expect, a somewhat earlier development than out-of-doors. Seedling, an a rule, are more precocious in their growth than old plante, and quite deciduous Ferna, like Athyria, with very little warmth indeed, will the firat year retain their frond right tbrough the winter, though laterinothing will prevent them dying down in the normal way in autumn, We have found, however, that even in a few generations, it in possitle, by alective calture under glans, to conaiderably lengthen the growing period of Athyriuma, shortening the dormant period in equal measure. Most of the plamone superbum section of this species remain quite green for fully a month after all their immediate progenitor: in the same house have withered entirely down. One form, indeed ( \(\mathbf{A}, \mathrm{f}_{0}-\mathrm{f}_{0}\) plamonum, Druery), is perfectly green at the time os writing (enả of November), and has been ao at Christmas; while, on the other hand, without any atimulus beyond its own inherent robustness, it riees into active growth a full month before its fellows. One year, indeed, a robust growth atarted on Dcc. 2, before the old fronde had even turned colour, but frost immediately after stopped its progress.
It would almont seem by this cane that further nelection might eliminate at one and the ame time the deciduous nature of the species,' and the dormant period also; this latter being decidedly reduced one-half in two generations, and nearly as much in one, since its parent is not far behind it in the long retention of its verdure, while the grandparent growing by their aide, dies down as early and as thoroughly as any Athyrium we are acquainted with.

How long the actual dormant period is, an compared with the apparent, is an open question, as well as that of the recaperative or atrengthening procenses which andoubtedly accompany them. The root certainly commence to be active long before there is any aiga of life in the crown. Hyacinth bulb grown in glanes are a familiar exemplification of this; and as regarde Ferne, even in the depth of winter the crown will be seen to be fattening up, implying great root activity and proparation for the coming rapid growth in the spring. It is highly probable, therefore, that in mont, if not in all carem, mach of the dormancy is more apparent than real, and that a good deal of secret and aubtle work is being done, of which we know little or nothing, but the need for which is evidenced by the weaknens
anbequently shown when the dormant period is unduly curtailed, and thene processen are interfierel with. Chas. T. Druery, F.L. S.

\section*{THE FLORA OF THE AMOUR LITTORAL}

The vegetable covering of the Amour country in luxariant and peculisr, and displaya a grat difiterece from the floras of adjacent parts of Siberic. Bre the woody vegetation exhibits a striking dinimilurity to that of Siberia and Transbaikalia. With the ordinary Siberian races of Conifers are here anociats the Mandcharian Cedar, the Pitch Pine, Abien ibibina, and an ally of the Conifers- the Yow peculiar to the mountains of the Cancasus. The flora of the folligy trees is very rich and varied, as it here meeth then beneficent influences from the eastern ocena, The genus Tilia is represented by two pecoliarly euten forms, T. cordata, Mill, and T. mandehurice, Rupp. et Max. The Maple, a stranger to the whols ol Siberia, has here four representatives; the Apple appears in Transbaikalia in the shape of a very mall fraited variety. Pyras is here represented by beautiful apecien, Pyrus unsuriensia, Maxim; and tho bird Cherry-Prunus Padus-by two local varietien Two local apecies of Walnat embelliah the foreta of the Amour, viz., Jaglan* mandeharica and J, tenocarpa Max.; and the Ash by a localied apecien unkoown to Siberia, Fraxinas mandecharicas, Rupa, With the European varieties of the Elm is ausocited Uimas montana [c momestrin ?]. Winckl. There in dioo a new apecies of Hazel, the Corglas mandeburien, Fioally, among the Birchea reappear a Kamtehuts variety, Betala Ermani (Ulmifolia), Cham.; and one local timber tree, B. costata, Trantr. Tho charming little tree of the Amour conntry, with a palmy crown, Dimorphanthus mandeharicus, Ruppr, is far removed from the Siberian species. It belooga to the natural order Araliacea, which loves a moint climate. Not less remarkable is the Cork tree of the A mour, belonging to the family of Xanthoxyluctan nowhere to be met with in the whole of Ruuia.

The abrabs of the Amour country are atill mon pecoliar than the trees. No fewer than twenty-fout apecies here met with are entirely new to anjuan arriving from Siberia and Tranabaikalia. Of then, three are climbing planta. They are, firto of ath a beartifal plant, pertaining to the rare family of Schizandracem, with pale rose-scented flowerr and red berries (Maximowitchia chinensia, Rupreds), apreading from Northern China through Mandeburis to the Amour ; a species of Vine, very alighty dip tingaiehed from Vitis amurensia, Ruprecht. Th apecies of Clematis appearing here belong to the nme climbing ahrubby variety of that genus. Of the tro apecies of local Barberry, one is alno peculiar io Northern China, Berberis ainensia, Desfontaine, too other, Berberis amurensis is local. The very carioul ahrub, Actinidia kolomikta, Raprecht, covered mith large white-scented flowers, has not yet found a atrictly definite position in syatematic botany, bed now classed with one and again with another of tho natural orders.

Of the four varieties of apindle-tree there in othe Eaonymusalata, Thunberg, which is alco foomd in Japan; and three local apecies, viz, E. paciliorah, Maximowicz, E. Maackil, Raprecht, and E. mactop terus, Raprecht. Of the Leguminoter, the small onrith found here, Lsepedeza stipulacea, Maximowicz, tho grows in the environs of Pekin. Of the Romerny the local apecies of Cherry, Prunua glandulifioinh Raprecht, and Meadow-sweet, Spirres amuretion Maximowicz, are shrubn. Two local specien, longing to the mame genus an our no-called grith Syringa (Philadelphus), are a conapicaous ment of the foreste, viz. P. tenaifolias, Raprechis of P. Schrenkii, Raprecht. The beantifal local sirais the mame family, Deutzia parviflora, Buage, il of Chinese plant, apread by cultivation. To the famia Araliacess, not met with in Siberis, belong two Cuis common to this fiora, and that of Northern Chinem Of the Honeyauckles there are here on and in apecies and two local, Lovicera Manckia Northat
Maximowitachii, Ruprecht. Common to Nol

Ching in a species of Lilac occurring here on the akirts of the woode, with somewhat minate wbitish flowers, Syringa amurennis, Raprecht. A variety of Laurel met with on the lower Amour is that called after Kamtchatka, Daphne Kamtchatica, Maximowicz.
Among the herbs of the Amour country, no fewer than 110 apecien are exclusively peculiar to this region; the rest are common to China, Japan, Kamtchatka, and even Americn, but more eppecially to
indicated that it might prove thy bearer. And these propheniez have been all too literally falflled.

As to the quality of this Pear there can hardly be two opinion. The Florist of 1875 , in giving a beautiful coloured wood-cat of Lacy Grieve Pear, summed it up in a sentence thus, "If we cannot claim for old England the parentage of many of our favourite Pears, we may at leat ansign to her some of the very bett in quality, and among these mut rank the abject of our present illuatration, of which excellent

Fig. 111.-rocy Grieve pear.
(Weight, 14 ozs. ; circumfereace, lengthwise, 15 inches; shorter girth, 11 inches.)

Tranbaikalia and Siberia. The whole flora of the Amour comprises 340 plants common to Earopean Rannia, whilat, with those of Tranebaikalia, it number: 527 varietien. J. St. Vincent Corcoran, Odessa. Sept. 14.

\section*{THE LUCY GRIEVE PEAR.}

Tris fine Pear, though it obtained a First-clans Certificate from the Royal Horticaltural Society on October 23, 1874, bas been comparatively little grown. It long thin Willow-like leeves, which anffice to diatinguish it from nearly all other Pearn,
amplen were aent to us last aatamn by Mr. Grieve of Culford."
Up to the present year thit fine variety hae neither been distinguished by free-growth or free-bearing; but aingularly enough 1895 has been a record year for this Pear. The anmple before me an I write, yru nu by Mr. Haghey, gardener to Thomas C. Porteous Oakna, E y., of Nowton Court, measares 15 inches in circumference lengthway 11 inches round at the widest part, and weighs 140 . Tais fruit, and there were several almost as large, in just at large again at that figured and described on p. 84 of The Floritt for 1875 , where the average weight is given at \(700_{0}\)

These fruite differ considerably from the type in other mattert, and are wo remarkable, that my wile has painted and forwarded a fac simile of the finest apecimen (6ig. 111). Ose of the pecular leaves is atill persistent from the end of the stalk, and is trae to its Willow-like character. Bat the Lacy Grieve Pear, like many others, is leas richly coloared this jear than uaual. However, it can hardly be said of the painting accompanying this note, that the colour is a deep lemon-yellow, though it is thinly and in some places thickly marked with ruset, and has a russet patch near the eye and the stalk. The flesh is alno moderately firm, fine grained, tender, and melting. very juicy, with a rich, luscions flavour, and a alight and agreeable dath of acidity auch an ia occasionally met with in the Glou Morcean. Since this Prer hat increased in mize, it become more like this fine old Pear at it beat, and possibly map have been raised from it. Bat the odour and the flavour of this Pear are more penetrating and agreeable. Dr. Hogg, our higheat authority on mach matter, calls Lacy Grieve a delicions Pear, having the textare and Hesh of Marie Louise-and aurely no higher praise can be given. The hiatory of this fine Praris thue pathetically written by the father of ite raiser, Mro Pater Grieve, 0 recently deceased :-
" It happened very long ago-
How long? we acarcely neem to know -
A fair young child, in joyous glee,
Piucked with her daring little band,
A ripe Pear from a tree.
And ate the mellow frait ahe choe
With all the zest which childbood knows;
Bat marvelled in it inmost core
Sismedark green pipe to afe;
And marvelied more to hear it told
That each imall pip oo plamp and bold
Might jet become a tree.
Then thoughtfully the pondered lomg,
How this thing could be so,
And lantly in a pot of earth
A ling eeed did now.
That aeed became a living plant,
And claimed her willing care,
While promises were kindly made
With friend its fruit to share.
In time the plant became a tree,
With foliage bright and fair;
The child, a merry little maid,
In fayour everywhere.
Affection cherianed for the tree,
Which cold and atorm could brave,
Bat long before it bore a fruit,
The maid was in her grave.
And when at lant it ripened froit,
They who full well do know,
Declare on Englana' fertile noil
No richer e'er did grow;
And ary that how that a fruit ochoice
It raiser'a name thould bear,
And be hereafter always known
As little Lacy's Pear."-P. G.
-D. T. F.

\section*{FLORISTS FLOWERS.}

\section*{PROPAGATION OF CHRYSANTHEMUMS.}

Early in the present month, and before the last of the plants which have borne large blooms are cut down, a beginning should be \(m\) ade in the propaga. tion of Chrysanthemame, for although the Chryannthercum season is short, a long period of time is required in caltivating the plant to perfection. Nowadays, when the large-flowered varieties are so numerous, eapecially those of the Japanewe section, and they are so highly thought of, poor blooms are not tolerated; and every gardener who grows these plant should make himelf acquainted with the best methode of cultare, so as to enable him to excel. A most important detail of culture is the propaga. tion of the plante.

It may be takea for granted that it inselen to hope for very fine blonsom if the atart be not early; no amount of forcing at any atage making ap for lout time. December is undoubtedly the best month in which to take cuttings, bat there is no one day which is better than another, and the gardener muts
be gaided by circumatancen-cutting of particular Farietien having to be taken when they are fit. There is also a difference in cattings, some being good, other bad. The beat hind of catting is that which springe up through the soil an inch or so distant from the atem, and is free from all traces of bude, fluwer-bud forming early at the point of a cutting, rendering it useless for propagation. A cattiag having a clean uninterrupted growth in ensential, without which the efforts of the cultivator will be in vain.
There are several method of striking cuttinga, rome gardeners preferring a cold frame, others a cool-houne from which front is simply excluded, but no artificial warmth employed, as this will cause the cattings to be unduly hastened. The cold frame answer very well when the weather is not very frosty, but it has the bad consequences that in period of aharp frosts there is a difficulty in affording air to the cuttings, to the loss of meny of them from damp. In a cool-houes capable of being warmed none of these drawbacks exist, and the rooting of the cutting goes on unhindered, and growth takes place without a check. The formation of a callus is hatened if the leaves are not allowed to flag, and there is no better method of prevening thin occurring than to place the cuttinge under handlights or in a mall frame, the pits atancing on coal-anhes, and an near to the glass as ponible, to prevent apindling. If one cutting be inserted in one amall pot, the repotting of the rooted p'ant is facilita' ed, and no check given. A eandy soil presed nomewhat firmly into the cetting-pots and cov red with a thin layer of and, in all that is necesaary for atriking the cuttings, the and hatening root-formation, an some of it is aure to be carried to the but:om of the hole when the catting is dibbled in; and the cuttinga of this plant root more readily in mand than soil. Having inserted the euttings, afford them a plenteous watering, and cover them with the handlight. Remove the top daily for about an hoar to disaipate moittare, and in the evening wipa the inaide of the top with a sponge. Water will not bs required before the cattings are rooted, but shculd the noil become dry it must be applied in afficient quantity to mointen the soil throughoat.

A period of from three to five weeka is required for the cuttings to becomewell-rooted, and when this has taken place the lighte should be tilted on one side, until the amount;of ventilation afforded in this manner is increased by degree till the cuttinge will bear exponare without their leares flagging. By this methed atocky growth and a thorough foundation are atsured. E. Molyneux.

\section*{CULTURE IN WESTERN AUStralia.}

It is pleanant to learn, through the agency of the Agent-General, that fruit and vegetable culture are making atiefactory progrens in the far-away auriferous portion of the globe which han so rapidly risen into fame all over the world. Orcharda and vineyard are gradually being developed in valleys where rivern or atreams of any capacity run, and in nome places, at in Perth, we are told that Grapes are sold at \(4 d\). per pound. Apricots, Peaches, and Melons also are gradually coming into market, and Strawberrien, Raspberrien, and Carrants are to be found here and there. Of coure, where the rainfall is limited in extent, caltivation is a ticklish job, bat then irrigation is made to asmert its beneficent power, and as population grow, so also does the extent of acreage under fruit and vegetable cultivation. Land is cheap enough, for it is atated that the cont of freehold in farms is something like 10s. per acre, the payment being extended over twenty years \(=6 d\), per nere per annum! And so, ponibly, is may come to pans that allavial gold may by-and-bye be found more eavily of acquirement than diluvial-as in Cali'oraia. By-the-way, it may be noted that frait tree and cuttings are nent from both New South Walen and South Australia. We are reminded by the Agent-Goneral that grame
needs are now placed on the free liat of imports, as well as garden seede. In the tariff-free list are to be found bulbs, fruit, and ornamental trees, acion and graftu, manuren of all kinde, plants, and Vine cuttinge. The following pay a duty of 5 per cent. ad valorem:-Agricultaral, horticultural, and viticultural implements and machinery (not garden rollers) ; wire netting and steel fencing wire, standards and staples.

The increase in the value of timber export is surely worthy of mention here. In 1893 the value of this export was \(£ 33,888\), last year this had increased to \(£ 74809\). It may not be generally known that the forest region of extra tropical Western Australia oc upies an area equal to the whole territory of Great Britain-the intratropic zone of forest is also enormoas, and there is many an indication that as time goes on more and more of the timber produced in these regions will find its why to the mother country. E. C.

\section*{The Week's Work.}

\section*{THE FLOWER GARDEN.}

By Bailey Waddg. Gardener, Birdsall Gardens, Fork.
the herbace ous borders.-The work of cutting down and clearing away the dead and decaying steco and foliage of perennial plants should now be fiainhed. Large plants of Delphiniame, Hemerocallip, He ianthar, Rac beckia, Irie, and Michatlmas Daisies, growing in old borders which are not going to bs repianted, ahould be taken up bodily with a spde, cattiog (ff and seplanting a good-nizad atrong ha althy clump cat from the outaide of the root-mase, affurding the \(t\) ansplanted portiona rotten manare and fres soil. These piecen will grow well and flower more tiafactorily than old undisturbed c'umps. Wher patting a border in order a! this season, place a short tous atske againat each plant which die completely cown. so that they may not bo \(t\) pr \(m_{p}\) ed upon; and when the work of cleaning and plating the borcern is fiaished, lightly prick over the surace affordiag a dressing of rotten manure and tesn lommyoil, and the aifted charred remaina of the refuse-beap, in all about 2 inches thick. Care should be taken that the top-dreasing is free from the seeds of weade. A few good indiapenable perennials consist of Alstromeria, in variety; Ancmone japoaica, and the white-flowered variety Honorine Joubrrt, and its double form ; Anthesicom liliago, Asters Amellus, g andifioras, Shortii, Nova Belga, and Nova Anglia; Campanalas peraicitlora, Carpatica ia b'ua and white varieties, grandia, latifolia, and many more; Doronicum: caucasicam, plantagineam excelsum, Harpur Crew, and Clusii ; Dalphiniams in great variety, Ery \(\operatorname{gin}\) mos, Ferala gigantea, Helianthay, or perennial Sanflowers, including the hows anfuati'olius; Inula glandulona, and I.g. granditora; Papaver nudicanle. P. orientale, Pæonien, Paloxes, Pyrethrum roseum, in great variety.

MI8CELLANEOUS MATTERA.-Now is the right time for examining the lawn-mower, repairing damages, aod generally cleaning and oiling the parts where there isfriction. The mower should be kept in a dry place. Flower-sticks, atakes, labela of all sorts and wiz 3 , fege for layeriag, thould be made; cattingbozes and plant-tabs well aired and then painted. The planting of deciduous treen and ehrubs may still be proceeded with, weather permitting; also the thinning-out and cutting-back of auch as are growing too thickly, and atakiog without any delay all atasdard trees which having bat small hold of the ground are likely to be injured by wind. The grans edginge to abrub beds may be trimmed, and the ail slightiy alirred with digging-forkp, taking care to bury the tree-leaves in the paces whare there are no roote to be injurad. Thorn and other deciduous hedges may be trimmed, keeping them broad at the bottom but na rowing towerde the top. If heavy nowfalls occur; relieve all choice sabject of the greater portion, before injury is done to them.

\section*{ILAKTE UNDER GLABS.}

\section*{By W. H. Swrre, Gardener. West Dean Park, Chichester.}

THE GREENHOUGE IN WINTER.-All hard-wooded plents much as Erican, Azalea indica, Rhododendrone, Boronias, Epacris, \&ce, will atand in need of close attention as regard their watering throughout the winter; and in regard to the temperature of the
greenhouse, a mall amount of artificial heat may be afforded, together with top and bottom rentilation in mild weather-a temperature of about \(55^{\circ}\) by day to \(50^{\circ}\) by night being anficient, the warmeth being allowed to fall \(5^{\circ}\) in very cold or windy weather, If any of the plants are infested with thripa, fumigute the greenhouse on two nights in acceasion with Richard'n Compound. Any necessary training ticking, \&c., may be proceeded with; and fer plante of Epacria, Erica hyemalis, and Boronia megaatigma may be placed in a alightly warmer house to bring them early into flower.

ADIANTUM CUNEATUM.-Where fronds of thin mpecies are in much request for catting, it is good practice to cut the fronds, ay of four to nix potiona, completely down, then allow them to get nomenhat dry at the roots, and place them in a temperatare of about \(70^{\circ}\) by day, and \(65^{\circ}\) by night, when they will soon push up new frondm, which as they grow, majbo gradually hardenod before cutting them as before. If plants of this species are treated in batches in this manner capital fronds may be obtained throughout the jear.

CHRYGANTHEMUM8. - The plants as fati a the flowers fade, and they lose their beanty, whould be cut down, for the Chrysanthemuma being generally gronped together, the suckers which will form tho sattinge get weak and drawn, and in some caus bleached in consequence; hence the need to roo move the top growth quickly. Place the atools, sa the plant are now called, in a light airy honse for a time, to allow the shoots to become firm before taking them, and as soon as that is apparent, recure the necenaary catting. After neatly trimming eack cutting, place it singly in a mall pot, in sandy loam and leat-noll; afford the cuttinga a good watering, and place them under a hand-light, or pot into a pit or house from which the frost is excluded. Gard againat damp by ventilating it in the morning, and by wiping the moisture off the glass daily if the hand light be used, and apply heas to keep out frot and disnipate excenive dampness. Two very pretty varicties for cat bloom are Jane and Yellow Jano and three very late one for Christmas decoration are Admiral Sir F. Symondn, Lady Canning, and Lads Lawrence.

LAGHENALIA TRICOLOR.-These bulbous plante, now in full growth, will require liberal aupplies of weak manure-water at the root when the pots basket: are found to be filled with roots. I find thas the plant flowers best when repotted in alternat years, or allowed to go for two y*ars. Keep the pold or baskets near to the glass, and turn them roond occationally, for the purpose of keeping the folisg evenly distribated all round the pots, \&c.

\section*{THE HABDY FRUIT GARDEN.}

By W. Porte Gardiner, Eighchre Cauthe, Newbury.
PROTECTING FIO TREES ON WALL8, ETCMeans should be devised, and material got in readinent, for covering Fig trees in cave of severe from setting in. Light aheep hardles neatly thatched with straw, and made long enough to reach the wop of the trees when placed in a leaning position, and tanding ont from the wall about 3 feet at the bottom, are a good form of protectora for out ofodoor trees, as beaides throwing off rain and nnomit they are eanily removed when necemary in rild weather, and with care will last for many yeanh Where, however, theare are not available, Spruce Pir branche or other evergreen trees may be omploped, and these, if properly applied, make a fairly eficied to protection. Straw bands are sometimes from tho onvelop the branchen which are taken off from in walls and bundled together, but this mend ito antidy, for which reamon I do not recommend io
prunina and training of TREES in aenerd -The proning and training should be cartuld be with dispatch, weakly or atunted trees shay of so cut-back severely, as thin slender growtas if pos formed frait-besring; and slmost invarisbly leall to atrong breaks. If the roots are in a healithy dition, the surface-soil thould be cleared away, a good drenting of material suitable for encor, yount root-action afforded. In the same manaer which treen that were planted last meanon, and hav failed to make a atiafactory itart, atarting poinh their branches cat back to the sath wi when in all probability a vigorons growth. resuit, and the tree greatiy benemary foinitis breen now being received from the nurnery
trees frequently arrive with vigorou growth on the upper part, whilat the lower part is either bere or furnished with only a few weak branches, which is a con aequence of the trees having been crowded in nursery plantations, and not getting enough light at the bottom. Such badly-farnished tree should be cat down to about 2 feet from the graft at planting-time; and from the strong growth which will reant a sufficient number moald be elected for the lower tier of branches, and for a stout leading ahoot, which may have the point stopped once daring the ammer. By acting in this manner, no serions loss is really incurred by what may appear to be too severe pruning, bat time will be saved, seoing that a handzome, vigorous tree is obtained sooner than would otherwise be the case. Lot the training of old and young trees quickly follow the praning, and in doing mo, closely examine the old fastenings, removing any that are tight, or which are not likely to last another season. The leather shreds introduced by Mr. Margatroyd, of Leeda, seem to be jast what is wanted for wall tree ; and, connidering thair probable darability, they are not too expensive. Young tree for horizontal training should not have the branches brought into position for the firt few years, but thould be trained at an acute angle, which will tend to the equal diatribution of the sap, and conduce to the health and vigour of the lower tiera, these bsing alter a time brought gradually into their proper position.

\section*{THE ORCHID HOUBR日,}

By W. H. White, Orchid Grower, Burford, Dorking.
HINTS ON WATERING.-As a rule, it is affording too much water at the root and too moist an atmoaphere, that are the chief causes of the deterioration in Orchids, and it is asfer to err, therefore, on the side of keeping the plants dry than on the wet side, eapecially if they are abjected to a reasonably low temperature. The ame distinction hould be observed when affording water to both tall and dwarf species of Epidendrum, as with Cattleyas. The plants of Chysis, Catasetum, Mormoder, Cgcnoches, Cgrtopodiums, and allied apecies should be kept comparatively dry whilst at rest. Warm or inter-mediate-growing Oacidiums, Guatemalan and Mexican Olontoglossume ahould be afforded water occanionally to maintain the plumpnens. Terete-leaved \(O\) chide require very little water whils at reat, just eaough being afforded to prevent shrivelling of any part. Small-growing apecies, as Promenæe, Rodriguezia, Paphinia, Comparettia, Coryanthes, Oacidiam palchellam, O. triquetram, Ionopsis, Barlingtonias, \&c., hould be carefully attended to, and water afforded them occaionally to keep them from perishing. The various pecies which occapy the coo!house, as Odontoglonsme, Masdevallias, Maxillarias, \&c., are growing almost at all times, and hould bs watered often enough to keep the compost moist.

DECIDUOUS SPECIES.-The plants of deciduous Calanthes, Thuniss, Cyrtopodiams, Catasetans, Mormodea, and Cycnochem, if properly matared, 'keep fresh-looking and plamp in the resting pariod without receiving any water. There are many species of Orchid in cultivation which bear a severe drying, and yet produce abandance of bloom, bat they do this generally for one or two seasons only, and then push out weak and prematare growth, gradually disappearing altogether. The object of beginners in Orchid calture should be to give the plants as good a rest as is posible, and see them anfely through the winter.

EVERAREEN 8PECIES. -Such evergreen epiphytal Orchid as Aërides, Saccolabiams, Raynchontyliu, Ronanthera, Stauropsie, Sarcochilue, Angrecums, and the tall-growing Vandas, do not require so long a season of rest an the deciduous species; still, the longer they are kep; in an inactive state, the stronger will be the new growth. Tase evergreen epecies hould never be allowed to get quite dry, and water must be afforded in mafficient quantity to prevent lons of foliage. The state of the aphagnum-moss, which has been growing laxuriantly, hould afford the caltivator an idea of the neede of the plant, and if it be allowed to assume a whitish-green colour before Water is given, it will nhow that the plant has been kept enfficiently dry. The whole of the mans of compoat ahould not then be atarated with water, bat the top-dreasiag of aphagnam-mons thould be merely sprinkled, so as to keep it alive. Phalenopsia Schilleriana, P. Aphrodite, P. intermedia Portei, and others, that are sending up their flower-mikes, thould receive mimilar treatment, Evergreen apecies,
auch as Cypripediums, Phaiue, Calanthes, Anecto chilus, \&c., require the shortent period of rest of any Orchids, and this should begin immediately the flowering season has pased, affording water paringly for a few weeks, when new growth will generally commence to be made.

DENDROBIUM8.-Dandrobiams, eapecially thoue of the deciduon or semi-deciduons apecies, require long rest, and no water at all at that seaton, ualess the peudo-bulbs shrivel, when water may be afforded in quantity afficient to rentore plumpnem. Dendrobiam thryailoram, D. densilorum, D. saavisaimum, D. chrymotoxam, \&5., which are evergreen, the nigrohirsute apecies, D. Lowii, D. cruentum, D. Draconi (ebarneum), \& co, and the cooler-growing varieties, D. infandibulum, D. Jemenianum, D cariniforam and ite variety, D. Wattianum, shoald be kept only lightly moist at the root when at reat.

CATTLEYA8 AND LAELIA8. - Ay regard Cattleyan and the tall-growing Leliap, experience teacher that at the so-called period of rest, the short pseudobulbed species, of which Cattleya citrina and Lalia majalim may be taken ae typer, require less moisture at the root then and at all other seasons, than the slender, tall-growing C. bicolor, L. harpophylla, \&cc. and those which have pseudo-balbs of an intermediate sizs, viz., C. Mendeli, C. Mossix, and C. Iabiata, nould bs treated accordingly. The object is to indace the formation of roots, bat not top-growth, and to do this, jast affisieut water to keep the pseudo-balbs and leaves from shrivelling much should be afforded the plants.

\section*{THE KITCHDN GARD쿄N}

By Johe Lambeat, Gardener, Powis Cauth, Weishpool.
DWARF KIONEY BEANB.-Saccentional owing should be made at regular intervala of fourteen to twenty-one dapa, according to the demand. The ail should be of a loamy antare, and rendered porous by asing road-grit, and, or leaf soil, in quantity to auit the kiad of loam. Some gardeners sow six or eight seeds in a number of mall 60's, sud transfer these before the roots are pot-boand, into 10 inch poss. A vinery sarted for forcing will bo a good plase for the seeds in the first atage. Susives saspended within \(1 \frac{1}{2}\) feet of the glass are well adapsed for French Buans. When the early batches of Brans have made considerable growth, sone wort of support from twign, or small stick and bast, becomes necesary. When the soil needs water, let enough ba afforded to reach every part, any atint in this matter cauning loss of bloom and poor growth. As A variety worth growing, Veitch's New Rinner French Bann should be tested especially at a later part of the winter, when hotwater pite may bs ased with good results in Bann cultare, althongh there is little doubt that red-apider will bo againat this varisty replacing the old dwarf ones for inside-work.
sprina cabbages. -Those Cabbegen which were plated as previously advised, having now become suady entablinhed plante, and therefore likely to withatand evere weather without lons, should be examined, and any gaps found in the lines filled up with ame of the bset plante remaining in the seed-beds; the plants freed from decaying leaves, the land from weede, and hoed rather hallow between the rown. Fiaslly, afford the plantstion a good dreming of fresh oot thrown broadcat over the plants ab well as the land, and then moald them up, chooning a day for this job when the arface is dry.

WORK IN GENERAL.-Many small matter will now require attention, unch as keeping up a supply of Lettuces for salad. If uader glass, so much the better, bat if these plants must remain out-of-doors protecting material ahould be at hand in case of hard frost. Thene may consist of mats thrown over hoops placed over the plants, or spare frame-lights, boards, \&cc. places remarks apply almo to Eadive. R jots of Dindelion and Chicory may be placed in the Mashroomhouse; and anccessional batches of Sakale should be put into heat, so as to keep up a regular supply. When mall quantities of Seakale are required, the roote may be placed in large flower-pots with leafmould over them; of course, keeping the light away from it entirely. Seakale should nut be hard forced, but brought on momewhe slowly, as it will be if the warmth does not exceed \(60^{\circ}\). Seakale roote intended to be forced this winter, may now be lifted, and the mall thonga for making aetected, barying these in soil antil time can be found on wet daya for making them. The crowns for forcing purposes ahould be laid in, in moint soil, litter being
thrown over them in time of frost. Asparague roots may be aimilarly lifted and laid-in, in eome readilyaccessible place. The old beda of Cabbages, if the plant were properly treated, will now be producing mall compact heads and spronta, tender and of good flavour. Thene Cabbage-beds should be cleared of decaying leaves, stripping thene off the tall atems, and gathering them by hand or raking them out of the bed, thu: affording air to circulate among the plants, and renderiag the plantation les obnoxions as regard odour. Yoang Cabbage plants pat out late in the nummer will now be farniehing good heads. Coleworts will be plentiful and good at thin seanom, wo that there will be no acarcity of Cabbages and Greens for the table. Brassele Sproats, the most highly prized of winter vegetables of the Cabbage tribe, thould be cleared of decsying leaver, \&z., buts carefully avoiding breaking the fresh ones. The bhort-stemmed atardg varietie are to be preferred, as they keep erect, are not so mach acted on by wind as the tall ones, which fall about a good deal on rich land, thas rendering the prout liable to have the soil aplashed on to them by the rain. Heaps of atable-dung, and litter, and fresh tree-leares, should be mixed and got in readiness for making hot-bode and renewiag the lininge to pite and framer. The cold pits and frames containing Parsley, Cauliflower, Lattuce, \&c., ahould have the lights removed daring dry mild weather.
mushroom beds. - Continue to collect and prepare manure for making new bede indoors ; and if a bed be made at intervale of three weeks, a good supply of Mushroome will be kept ap. Freah bed give the more delicate Mashrooms; atill, those bed which have been in bearing for aome time, will, if kept moist, and the house at the proper temperatare, continue to bear for a considerable length of time. The water applied to a Mubhroom-bed should not be of lese warmth than \(85^{\circ}\) to \(90^{\circ}\); and a bed if damped with the arringe occaricnally, and kept covered up with batt, mats or litter, will not require heavier wateringe, affording the being a mistaken practice. The covering of Mahroombed. out-of-doorn, when very wet, thould be removed and their place supplied with light dry materialt.

FRUITB UNDER GLABS

\section*{BJ Biorand Pareet Gardener, Goodhood Chichester,}

THE LATE VINERY. - Owing to the favourable season, late Graper fiaished well, and with care the bancher abould keep in good condition throughout the winter month. The buaches should be left on the Vines till the foliage has fallen in a natural was. At present all the principal leavea are atill perfect on oar Vines, bat they are changing to the uaual beautiful tint of decay, bas will not entirely drop for a fortnight. To remove these leave would not improve the Grapes in any way and there would be the danger of robbing the futare frait-bude of some acceasion of atrength It is, however, necessary that such ma-light as we have, and unimpeded circulation of air, thould be afforded, and to obtain these, the ahoots may be thortened to within two or three leaves of the bunch all lateral growths should be removed. Ventilate freely dariag bright weather, and apply fire-heat when the temperatare in the vinery is likely to fall below \(45^{\circ}\), or daring wet and foggy weather. The buacher of Grapes should be examined once a week, or oftener, and every berry showing the least aiga of decay, removed; for to allow one decaying berry to remain is to riak the lon of the entire banch, to quickly does decay spread. It is general for the roots of late Vines to have access to outside borders, and these require protecting from now and rain during the winter, which is best done by covering the border with mhattern, or failing these, with a thick layer of ripe bracken, letting the protecting materials remain till the Grapen are cut, but no longer, full exposare to the weather being then best for the Viner. These remarks apply to vinerie entirely given up to the Vines; but where beddiag plant and othera are stored, it in better to cut the bunchen of Graper at thil date with a good length of shoot attached, and keep them in bottlen of water in the uaual manner in a dry cool room.
gTrawberries im pots.- Piante placed in cold pite or frame:, aad afforded fall exponare, ahould have the frams-light pat over them, if falls of snow or aleet threaten; and it would bs well after this date to protect the plat from heary rains, for should severe frost follow theme, they would suffor more from the soil baing wet, but the lighte whoald be again removed on favourable occasione.

\section*{EDITORIAL NOTICES.}

\section*{Advartisements should be ment to the PUBLISEER.}

Local News.-Corresponients will greatly oblige by sending to the Editor carly intelligence of local events likely to be of interest to our readers, or of any matters which it is derirable to bring under the notice of horticulturists.
Letters for Pubilcation, - All communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN OR ONE SIDE ONLX OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but kept as a guarastee of good faith. The Editor does not undertake to pay for any contributions, or to return unused com munications or illustrations, unless by special arrangement.

SALES.

CORRECTRD AVERAGE TEMPERATURE FOR TGE ENSUing Week, deduced frjm the obgervations OF FORTY-THREE YEARS, AT CHISWICK. \(-40^{\circ} .8\)

Last week we published thesecond
Fpping Forest. report of the Commissioners appointed by the City Corporation to investigate into certain charges as to excessive thining of the trees throughout the Forest generally. This report practically exonerates the Forest Conservators. In a large area of 5542 acres, tenanted largely by "gaunt pollard Hornbeams," which must be partly conserved and partly cleared for the young trees springing up, which must in time displace these said pollards, there is room for difference of opinion as how best to keep up the character of the wood as a " natural forest," in terms of the Act of 1878. There is not much occasion for wonderment at those lovers of trees and shrubs and under-growth of miscellaneous desoription, who live on the spot, protesting in the pablic prints. Unfortunately, the noisiest critics, however well-meaning, are often the least informed on the subject-matter in hand, as this Epping Forest question has fully illustrated. If the controversy were confined to the proper channels, where arborioulture is apprecisted and understood, the wild ideas of irresponsible individuals would never be published. As it is, the conservators and their superintendent must be greatly strengthened in their labours by the unanimous finding of the experts.

In a forest of this kind, which has not been a natural one in the general acceptation of the term, at least since the days of wholesale lopping began, it is desirable to have as many and as varied features as possible. There are by far too many pollarded Hornbeams throughout the whole of Loughton Manor, and we cordially endorse the recommendation of the Commissioners to have mach larger clearings than have hitherto been effected, so that eventually spear trees may grow up. It is not wisdom in such a large area to thin out so as to leave individual pollards; it is much better to have groups of these fantastio oripples, with the ondergrowths of Brambles, the Dog-rose, the "May," and the Blackthorn olambering roand and amongst them. It is delightfal to see how those Thorns proteot the seedling Oaks, Beechea, and Horn-
beams from the bite of oattle, and the progeny rearing its head above eye-level, will establish itself, and become one of the new features in time to come. Moreover, there are many hundred acres through whioh it is scarcely possible to crawl, so close are the tree-stems, and the oanopy of leaves shuts out completely the light of heaven from the ground, stifling any attempt at herbaceous life rearing its head.

In certain portions of Monkwood, about which there has, in time past, been a good deal of heated controversy, many of the Beech trees are magnificent specimens, and possibly, in time past the thinning has been a little severe, more especially as no underwood will come up under the dense shade of the Beech, and the clearings have not been bold enough to ensure a young crop of seedling trees in the intervals. About Theydon Manor, espeoially the high wood, Beech is the feature, and it ought to be maintained. There is a pleasing sensation, almost equal to walking over a Turkey carpet, to tread upon a thick layer of Beech leaves.

The ohiel seat of the Oaks is in Bury, or Hawkwood, and there has been a unanimous expression of opinion as to the conservation of these trees; indeed, the report says, "We attach great importance to retaining the character of this portion of the Forest as an Oak wood, and we would recommend that nothing further be done here beyond the gradual olearing-out of the pollard Hornbeams." If Oaks are to attain large dimensions, it is surely in this low-lying quarter. What has been cut out has improved the character of the remainder. It is exceedingly desirable to show boles of Oaks as well as tops to the forest wanderer; and after the Hornbeams have been seen to, and proper provision made for the upgrowth of young Oaks through the encircling shelter of the underwood, room should be made by judicious thinning, even of the Oaks themselves, for the growth of fine trees, and the formation of picturesque groups. They do much better in this wood than in the adjoining paddock, opposite the Royal Forest Hotel in Ching. ford Earl's Manor. The Oaks here seem to be as aged as any speoimens throughout the Forest, but they have neither attained bulk nor altitude, and seem to be in the downgoing period of their existence. Such fine examples of Oak pollards as are to be seen in Lord's Bushes, one of the offshoots in Hatch Manor, ought to be preserved. The underwood, especially the Hollies, is making fine headway, and the general vigour of herbaceous life at once shows the fertility of this spot.

The Biroh is making headway wherever the forest fires have stamped out tree-life. There are some charming young trees of this, whioh, with a beantiful pendent habit aud graceful foliation, well meriting the title of Lady of the Woods, have straight prominent silver-barked stems which lighten the sombre winter scenery. A few miscellaneous trees are springing up, such as Syoamore, and a stray Aspen or two, bat these are not encouraged. On the other hand, the Common Crab (Pyrus Malus), is encouraged and has not been pollarded; it is beautiful with its abundance of flowers in spring, and its fruits which generally are plentifal, and which the herd of deer eat with great avidity.

The picturesque undulating ground on the one side of the New Road, comprising many salient spots both in Loughton Manor and in Theydon Bois Manor, admits of making many vistas which would greatly relieve the eye of the visitor, shat up for miles, so to speak, within living walls of trees, and so doen thecorresponding groand on the other side of the New Road, particularly in some parts of Sewardstone Manor and Waltham Holy

Cross Manor, in order to open up the nice bit of pastoral scenery beyond the river Lea. These rides and beaten irregular paths over the forest generally lead to scenery which is shat ont from the eye and which is worth opening up, and thas enhanoing the forest effects. It has hitherto been dealt with in far too gingerly a way, no doubt, because of the ceaseless agitation of a fem busybodies. The best of the out-of-the-why features have arisen from conflagrations. Quan tities of the common Brake have sprong up, which, now one mass of russety-brow, is grand after the summer greenery; and then the masses of Furze, and Ling, and Heath, doing battle together wherever there is headroom and light are simply oharming-all the more so where there is breadth of space.

In such a large area as this, so near a great city, it would not be ont of place, neither would it be entrenching upon the reading of the con. ditions of transfer from the Crown to the pablic, to clear an area free from Hornbeam Pollards to form an arboretum, and introdace some of the deciduous trees and shrubs; and coniferous trees of other countries for general gratification and study Ther need not be distributed to alter the character of the forest, but a collection of them suitably arranged would form splendid object lessons for all who cared to proitit by them. Although the Act says that the natural aspect of the forest is to be preserved at all times as far as possible, it also says that the forest is to be "kept as a place of recreation and enjoyment" to all. This, in our opinion, would be a place of enjoyment to many, as it would enable them to see the arboreal wealth of othes countries, " no one daring to make them afraid."

Begonia incomparabilis \(\times\). -One of the mot remariable exhibite at the last meeting of the Rojul Horticaltural Society was a noble-looking winterflowering Bagonia (fig. 112, p. 681) exhibited andes this name by J. T. Bennett. Poï, Esq., of Cheshuato It originated in the south of Ireland, as we learn from its raiser, as a croas between Begonia polypetala and B. Froebeli. The foliage is very handame, the leaver being nearly a foot acrose, and covered with a velvely pabescence of a pretty pink hue when young. The inflorescence is nearly 2 feet in height, atanding well ap above the foliage, and bearn numerous acartet flower each about an inch in diameter. Before expansion, the flower-atalk is decarved, and the flattened flower-bada covered with dense whitith pubencence. We congratulate Mr. Poei on the acquitition of so remarkably fine a plant.

OUr Almanack.-Secretariee of Horticultarel Sccieties and othera, are earneatly requented to for ward immediately, the datee of Show Fixtures and of Meetinge of Botanical and Horticultural Societia of any kind for 1896, for intertion in the Almansth, to be pablished in our isnue for January 4.

The Royal horticultural Society. - TM next Frait and Floral meetings of the Rojal Hortio cultaral Society will be held on Tuenday, Dr cember 10, in the Drill Hall, Jame: Street, Victaris Street, Weatminster. The committees will met a asual at 12 o'clock. An election of new Fellow will take place at 3 PM .

National Rose Society, -At the Socitj' Cryatal Palace nhowe in 1896 and 1897, the follonits valuable prizes will be offered for Roses rainod, ars firat distributed by Mearm. A. Diceson \& Sass Newtownards, co. Down, Ireland. There will bo clans for amateura for in diatinct varieties, and another for nuraerymen for twelve varietief. In ena case the firat prize will be a handsome Silver Cap and \(£ 2\), aecond prize \(£ 2\), and the third prizs \(x\), Each Silver Cup must be won twice (not necens the two years in anccersion), before it becomisy property of the exhibitor. The above prite
presented by an amatear member of the Society, who wishes us to make these clases known now in order that intending exhibitore may be better prepared for them next jear.

Reduction of Rates for Small Parcels On
be sent to and delivered in the metropolis at rates for carriage varying from \(4 d\), for 20 lb , to 18 , for 60 lb . This is very greatly lem than any railway company has carried for before; and aince the Great Eastern covers the district where the depresaion has been most acate, the results that follow this departure will be noted with great iatereat. It will
hope to tee other companies follow in its course, and thus prove that the popalar in aleo the paying policy.

Societe Nationale d'Horticulture, Parib, -At the meeting of this society beld in Paris on Thuraday, November 28, M. Pextang, of Bruseels,

Fig. 112.-bigonia incomparabilis \(\times\) : flowers, scarlet. (bie p. 680)
opinions an to the causes of the prevailing deprention in the agricultaral counties, but there has been something llke unanimity apon one point-the quention of railway rates. The experiment began on Monday lat over the Great Eantern Railway ayatem is, therefore, of great interent, and makes it possible for the farmer and market-gardener to get into direct commanication with the consumer in London, Packagen of dairy and garden produce may now
now be ponible for the contumer to have his weekly parcel of batter, egge, poultry, fruit, and vegetables direct from the producer without the intervention of the middleman. One or two thing more seem to be needed, viz, a list of farmers, gardeners, and others, who are willing to apply castomers under the new arrangement, and a syatem of payment on delivery. Should thin venture turn ont remunerative to the Great Esatern Railway, we may
thowed some fine hybride of Cypripedium: C. Leynenianam (C. bellatulam \(\times\) barbatum Crowi), C. Senatear Montefiore (marmorophyllam \(\times\) Spicerianam),
C. Niobe (Fairieanam \(\times\) Spicerianam), and C. Chantini \(\times\) Sullieri Hyeanum, mplendid plant. From the ame exhibitor came grand plant of Ojontoglonanm (Miltonia) Leopoldianum, to which an award of a silver medal was made, Menarm Cappe et Fils showed Cypripedium monte-
num, which in nomething in the way of C. Sanderm, M. Don ahowed a magnificent Cymbidium Hookeri; and some good plantm came from M. Lasurur, among them a good form of Odontoglonsam cuspidatam. Mr. Bert exhibited several good Cattleyas; Meamin. Doval ex Firs, Verailles, preeented a plant of Miltonia vexillaria superba, and a fine lot of Cypripediam Charlenworthi.

Dinner to Employés at Ryecroft Nur-8ERY.-On Ssturday evening, 30th ult., some thirty of the staff at Mr. Jones' nursery, were entertsined by him at dinner, the latter being followed by a masical entertainment, in which both amateur and profenional artistes took part.

Royal horticultural Society of Aber. DEEN.-The annual general meeting of the member of thia society was held it the Masic Hall Baildings, Aberdeen, on Saturday, the 30th ult. Mr. D. M. Smitr occapied the chair, and there was a capital attendance. The aciety held one exhibition during the season in the Dathie Park, which proved, from a horticultaral point of view, most succensful. The entries numbered 2021, thin total being surpanaed by only one society in Scotland. Mr. J. Munro, nursoryman, Barnside, in criticising the report, thought they should look more to horticaltaral mattere, and leave musical and "fire-eating" matters to take care of themelves.

The Gardens in Lincoln's Inn Fields.The London County Council ara having the grounde of Lincoln's In Field thoroughly drained, the arrangements in that resect having bsen of the most primitive and inadequate character. The pathe are being levelled and gravelled, and later on the bedu and shrubberie will he overhauled, and in many inatances replanted. The gardens have proved a great boon to the poorer inhabitante of the adjoining thickiy-populated dintricte. There is a fine groap of Planes in the centre, and little or nothing needs to be done in the way of altering the plan.
"The Journal of Botany."-The ateady increase in the namber of papers which have been nent to the Journal of Botamy for pablication during the last year has forced upon the editor (Mr. James Britten) the conaideration of means whereby to meet the demands upon its space. This increas is gratifying evidence that the Journal in recognized as a suitable mediam of communication with the scientific world. The financial position of the Journal does not, however, warrant any additional expenditure. For the last few years it has not, as was at one time the case, involved any lows, but it does little-in some years nothing-more than pay its way. After discussing the position with various botanista, it is now proposed to enlarge the Journal by giving an extra sixteen pagea monthly, and to raise the price of each number to \(18,8 d\). , and of the annual subacription to 16 s. This mean that the contents will be increased by one-half, while the charge will be raised by one-third, so that anbacribers will be the gainers by the change. At times, of course, it may be desirable to aubatitute one or more plates for the additional pagee, but the general reault of the change will be that each number will contain forty-eight pagen, instead of thirty-two at at present. It is saggested that the list of subucribers might easily be enlarged, if thone who already aub. acribe would induce their friend to do so. There are many who, for the sake of encoaraging science, would be willing to add the Journal to their list of periodicals, or who would present it to some reference library. The work of editing the Journal for aixteen year: has been conaiderable, and fanncially unremanerative, and this gives the Editor a claim to the support of thome interented in any branch of botany.

A French National Chrybanthemum Society.-A now Society has been formed in France on the aame lines as our own National Societp. The subseription is fixed at 5 franes, and the Secretary is M. Pnurfy Rivonam, 16, Rae d'Algèrie, Lyon,

Journal of the Royal horticultural SOCIETY. - With commendable promptitade, another number of the Journal of the society (vol. xix, part 2) has appeared. It contains, among other things, papers on Fruit Culture in France, by M. C. Baltet ; a full account of the Crystal Palace Fruit Show, and the two Priza Ensay on the Commercial Aspect of Hardy Frait Growing, by Mr. Lewis Castle and by Mr. S. T. Wriant reapectively.

Honours to Horticulturiste. - On the occaaion of the Chryanthemam exhibition in Paria, M. Mabtinet, the editor of the Jardin, was made Officier d'académie in acknowledgment of hia mervices to the exhibition of French fruit in St. Peternburgh. M. Ernest Bercmann, on the same occaaion, wan made Officier du mérite agricole. The Emperor of Russia has conferred on M. Max Corno the grand croas of the order of Stanislan. M. MARtiner is made commander of the same order. M. H. L. de Vilmorin is made a Chevalier of the Order of St. Anne. These last appointmente have been made in connection with the great frait exhibition at St. Peteraburg in 1894.

Frozen Flowers from Australia.-It is atated in the Westminster Gazette of November 28, that a fine collection of blue and white Water Lilies (Nymphæa gigantea) has been sent by a leading floriat in Syduey, N.S.W., through Sir Sadl Samurl, the Agent-General, for presentation to her Majesty the Quern. The Lilies were frozen in ice, and received as long ago as August last by the Colonial Consigament and Ditribating Company, Limited, being atored at Nelson's Wharf, until Wedneaday, Nuvamber 27, when they were delivered at Windsor. In pite of the length of time, the Aowern were in perfect condition, and, scen through the transparent ice, were very attractive.

Vegetable Fibreb - Dr. Mormis' lectures on this aubject before the Sxciety of Arts have now been repablished in a complete form, and may ba had from the Society of Arts, Adelphi, London. They prement within mall compasi a readable account of the natare, properties, and mource of vegetable fibre generally. Oa looking through this excellent nummary, the reader will be atruck with the small number of apecies which have up to the present time been atilised. Tais is the more astonishing, as the great majority of plant yield "fibre" in some form or another. Is there not here an opportanity for our botanical stations to institute, on a far larger acale than they have hitherto done, comparative trials of various fibre-producing plants, in order to ancertain which are of the mont comonercial importance. In the mean time we commend the present pablication to the notice of all concerned.

Mr. Barron's Retirement. - With the last meeting of the Fruit Committee for the year, which takes place on Tuesday, December 10, at the Drill Hall, will be terminated Mr. A. F. Barron's long connection with that body as secretary That there will be considerable attendance of member is probable, an wach in unally the case on the last meeting of the year; but in view of thia leave-taking, the attendance at this particular committee will doubtlens be unusually large. The occasion is a fitting one for some formal proposition from the members, which should be recorded on the minute of the committee' proceeding, and no doubt auch proponition will be forthcoming. In the meantme, we have great satiafaction in announcing that at the last meeting of the Council of the Royal Horticaltaral Society it way resolved to elect Mr. Barrox at an Honorary Life Fellow of the Society. Mr. Barron was also elected to aerve on the Frait Committee for the ensuing year.

Colour in Butterflies. - The acalea on the wings of the Pieridw, to which the Cabbage butterflies belong, are nown by Mr. Gowland Hopiniva, of Gay's Honpital, to contain uric acid, to which oubstance, in fact, they owe their opaque milkywhiteness. The acales of allied yellow insecte alao
contain a anbstance nimilar to uric acid. Pigments of this character are not found in other batterfien, so that when the Pierid "mimics" an ineect belonging to another group, the pigment in the two cases may easily be diatingaished chemically. Thene carious observations show that there in a close ansociation between pigement of a decorative charactar and sabatances of an excretory natare.

Rosarian's Year-Book. - The Right Hon, Lord Penzance will, we underatand, contributa a paper to the forthcoming isune of the Rosarizn's Pearo Book on the "Hybridisation of Roses," with apecial reference to his expariments on the Sweet Briar,

Propored Memorial to the Late Dr. Woodman. - We learn that Mr. E. J. Jarmar, aed merchant, Cabrd, Somersetshire, has kiadiy andertaken the daties of Hon. Treasurer to the Fand which han been atarted, with W. Nappre, 489 , Kiug's Road, Chelsea, S.W., as Hon. Secretary. With mach workers, the work cannots bat be anccesafully carried out, and it is hoped that after erecting the anggented monucaent, a mubstantial balance will be left for the benefit of Mra. Woodman.

Christmas Numbers. - The Chriatmas number of the English Illustrated Magazine (illuatrated London Neves Office, 198, Strand), contaian many talen interesting to read and appropriste to the forthcoming season. Iule Tide (Cassell \& Co., La Balle Stuvage Yard, E.C.), is verg good this year, and the coloured plate, entitled "Prisonern of War," is a refrenhing change from the too plentifal pictares of kittens, pappies, and maidens usaally seen at thit season.

Mr. Buysman. - We have more than once taken occasion to praise the almirably dried apacimens of plante, chiety of economic pecies, prepared by Mp Bugaman, of Middelbarg. It is with regret, therefore, that we hear that the sight of this able preparer is seriously threatened, ia consequence of ovar. application, and that aome of his friends are deairom of giving him some assiatance in the ahape of clerical help in his work. Taose who feel disposed to contribate in thi laudable object, are requested to commuaicate direct to Mr. Borsman, Middelburg, Holland. It is eapeciaily and that a breakdon hould occur, just when the initial difficalties of his enterprive aeemed to have been fairly overcome.

Potato Scab.-Potato ecab is caused by tho attack of a minute vegetable paranite, at was fint demonatrated at the Pardae Agricultaral Station. It chiefly attacka the crop throagh infected aod material. The seed material may be dicinfected by immertion in a bath of corrosive sublimate. At corronive aublimate in a deadly poison* when amellowed by man or beatt, great care mat be exercied in handling ito The corrosive sublimate solution hould be of the streagth of one pro mille ( 20 on to 15 gall. of water). The bath should be about all hour and a half long, although ame variation in time is immaterial. Catting and planting is done as noual. The result of the treasment in a crop eneno tially free from sarface blemishes, and of greater market value. Sometimen a considerable ineresm in yield results from the treatment. The mothod if easily and cheaply applied, and in worthy of extended trial. (Abstract of paper pablished by J. C. Aergive in Bulletin Purdue Agricultural Experimsut Station Auguat, 1895.)
"Megny's Chinebe Mibcellany."-Wo hafl received the first number of this publication, pubs lished at Shanghai, and destined, as it appears, to bo an encyclopsdia of things in general concernias Chins and the Chinese. "The author, haring lirod more than thirty yeare in various parte of Chien one-half of the time entirely isolated from foreigners, speaking nothing but Chinese, in consialy commanication with the highert officiale, holding

An antidote that is probably as good as can bo had rasiay at hand is the white of egr. But no remedy can be of unlese administered without delay.
nocial intercourae with all clanem of the people, travelling extenaively by land and water throughout the whole of the eighteen province of China proper, note-book in band, and keeping a journal of all his movement and experiences, has acquired an intimate knowledge of the manners and customs of this peculiar people, and accumulated a vant amount of the most useful and most interesting information, which will now for the first time be placed before English-reading people in the handieat form imaginable, and on the most reasonable terms." The first number, so far at goes, certainly juntifies the author's claims, but it aleo now that the wervices of a competent editor are needed to digent, condense, arrange, and in some places to correct the vat mans

The Chinese name for this plant, it appears, is Anxion Desire, in reference to "the sorrow of nome widow who wept under one of the treen [climbing thrub, rather] and died of her grief." Acacia concinna, the Mimona aponaria of Roxburgh, is mentioned on account of ite poda, which contain a detergent principle which enables them to be ued in place of soap. A. nemu is indicated a a menitive plant, the bark of which is used for medicinal parposes.

The Royal Gardeners' Orphan Fund.-A meting of the executive committee of the above took place at the Hotel Windsor on the 29th ult., Mr. Wifilar Marshall in the chair. The following

Fig. 113, chrysanthamum m. chenon de lechí.
colours: rost buff upon a yellow around, and the tips of the florets, yellow.
of varied information collected by the author. A clasaified index at the end of the jear will also be requinite. Mr. Megny noter the aingular accuracy of the narrative of Marco Pono, in whose tracke he has in many cane travelled. The items of information presented to us in this first number are so numerous and so varied, that we have a difficulty in making any selection suitable for our readers, bat in justification of our remark as to the need of an editor, we may mention that the seeds of Abrus precatorius are described as "berrien." This atatement is more than a mere technical error, an it leads to a atatement that Tatarinof fell "into the popalar error, and confound this "berry" with a genuine apecien of Bean perfectly din inct." The need., which are perfectly well deacribed by our author, are in reality very clonely allied to Beans, and are contained like them in a pod or legame.
apecial receipt were announced: Rugby Chryannthemam Society, asle of flowers, \(£ 528,6 d_{0} ; \mathrm{Mr}\). F. Miller, Margate, £1 10s.; Mr. G. Harvey, Stanton in Peak, £1 5s.; Mr. Malcolm Dann, \(£ 1\) 1s.; Mr. J. Miller, Ruxley Lodge, 10s; Young Gardeners at Raxley Lodge, 10s.; Mr. H. A. Barberry, Birmingham, 15s.; and Mr. J. Lemmon, Elm House, Chichester, 5s. From boxes, the following ams were announced:--Per Mr. T. Tarner, Royal Horticaltaral Society's Gardene, Chiswick, 16s. 1d.; Mr. G. T. Cole, Charters', Accot, 16s.; Mr. J. McLeod, Rochampton, 15s.; Mr. R. Scott, Bradford, 14s. \(2 d\); Chielehurst Gardeners' Asmociation, per Mr. J.Lyne, 10s ; Mr. A.D. Christie, Ragley, Alcester, 58, ; Croydon Chrymanthemum Society, per Mr, W. B. Beckett, 21s, from boxet for viewing the collection of Chryanthemums at The Grange, Wallington, per Mr, G. W. Cammine,
£2 10s. It wat resolved that the annual meeting and election of orphans to the Fund hould take place on Friday, Febraary 21 next. The naual vote of thank was pased to the chairman for preniding.

Importation of Horee-radigh.-Of all the garden and farm producte annecenarily imported into thi country, there is none to our mind less warranled than that of Horae-radiah, which comes into Covent Garden in buge barreln from Holland and Germany. The aubject was incidentally referred to at the Drill Hall, on Tuesday week last, when Mr. Masos was apeaking about Asparagus culture. That gentleman has grown Apparaga and Horte-radish for market during many yeara, but has always to combat this extraordinary prejadice in favour of Horte-radish from Holland. Is the imported root of better quality? Not a bit of it! The roote are admittediy larger, but they are correapondingly lese effective, and Mr. Mason declared he could eat a quarter of a pound of it withoutita causing him to weep! Eoglish root are maller and very much better in quality, yet these may often be seen lying in Covent Garden lacking a purchaser, for the very reason that they are Englinh. Surely the ways of the British public are incomprehensible. Can the moral ba this: that British growers, if they desire the confidence of their countrymen, mat give them Horneradish that will not canse them to weep?

The Surveyore' ingtitution. - The next ordinary general meeting will be held on Monday, December 9. when a paper will be read by Mr, F. Punchard (Fellow), entitled "The Working of the Agricultural Holding Act, 1883." The chair will be taken at eight o'clock.

Publications Received.-From the New York Experiment Station, Builetin, No. 91, for Auguat, 1895, including papers on "A New Strawberry; Strawberrien, Rapberries. Blackberiee, and Dew-berries."-Bulletin of the Botanical Department, Jamaica, vol. ii., Part 9, the content include paper upon "Esential Oil of Orange, Caltivation of Cocon, Cultivation of the Coco-nut, Chemical Selection of Canez, and Synoptical List of Ferns."-Report on Government Botanical Gardens, Saharanpur and Mussooree, for year ending March 31, 1895. Satisfactory in spite of an uofavourable season as regards weather. -Landbouwkundig Tijdschrift (agricultural journal), onder redactie par Prof. Dr. J. Ritzoma Boa, Mr. A. D. Van Aasendelft de Coningh, Prof. Dr. Adolf Mayer en Dr. A. M. Prins, Afl. 6, Te Grovingen Bij, J. B. Woltert.-The Quiver, for November. Firat part of a new volume, and quite up to the usual standard of excellence.-Nature Notes, for November, contains as uaul many jottinge interesting to lovera of natural history.

\section*{PLANT PORTRAITS.}

\section*{CHRYSANTHEMUM M. CHENON \\ DE LECHE.}

Tas in one of the beat and mont attractive of the newer varieties of the Chryanthemum. In refined character will make it popular with everyone desirous of encouraging such a clan of bloom to the excluaion of extra large flowers which combine with them a
certain amount of roughness. A pare reflezed Japanese variety, the colour is a beautiful rosy-buff apon a yellow ground, the tip of the forets yellow, and the reverse of the anme colour. There is a distinct and attractive appearance about the flower not eaty to dercribe. The floreta are very long, regular, and of average width. Mr. W. Wells, of Earlswood Narserie, Redhill, to whom we are indebted for the photograph, informs us that the plant is an excellent doer, and grow only about 4 feet high. The bloom represented by fig. 113, is one of two that were produced by a plant in Mr. Welle' nursery that only arrived from the raiser (E. Calvat) in March last. Oae of these blooms was included in Mr. Wells' collection of forty-eight at the Aquarium, and the other one was hown in competition at the Hall exhibition. The larger bloom measured exactly 8 inches across, and was about \(5 \frac{1}{\text { I }}\) inches in depth. The variety has been certificated during the present season by the National Chryeanthemam Society, and an Award of Merit has been conferred apon it by the Royal Horticultural Society. It may be usefal to add that the variety does not succeed upon the "first crown" bud, and in in this particular dissimilar to the excellent Boule d'Or ' 95 .

\section*{Home Oorbespondenoe.}

DAPHNE INDICA RUBRA AT BERKELEY CABTLE -Amongat the many features of intereat at Berkeley Catte is a perfect hedge of Daphnes, growing in ons of the hoases, planted out in a border. I consider them wonderfal examples of caltivation, being the picture of healthy development, well farnished with branches down to the ground, with many huadred of trusses of sweet-acented flowers, diapensing the fragrance around. These plants average 5 feet to 7 feet in height and breadth, and as much through Mr. Shore informed me that the largent were atruck from cattinge foarteen years ago; all of them are on their own roots (not grafted). He keeps propsgating them in this way, and the plants of less than one year old are 1 foot in height, proving that on its own roote, when properly grown, Daphne indica rubra is a valuable plant for winter flowering. At Berkeley the plant is freer than any grafted plant I have ever observed. The Cgclamens, Primulas, Carnations, and Chrysanthemums are very attractive just now, all being well done, Rusticus.

CRABS AND APPLEB IN PLEASURE GROUNDS.Your correspondent "D. T. F." does well to recommond the ane of these plante in pleasure grounds, and more eapecially for arches. I can imagine that the effect would be very charming. I think it a great pity that Crabs and Apples are not planted more extenaively in pleasare gardens; for if the trees were placed in suitable positions. the effect in the spring tims would be very gratifying, and in the autumn a mource of pleasure, especially where varistien fit for dessert would, \&c., also planted were used. We have this sutuma planted several good varietien of dessert Apples to form a background to beds of Lilac and Labarnum in the grounde here, but I should not advise Crabs for this purpone, especially Pgras Malan baceata on account of its habit to run upwards. This variety is more auitable for woodland acenes or any place where ite slender form would correspond with the immediate scenery. George Burrows, Berwick Gardens, Shrewsbury.

NATIONAL CHRYBANTHEMUM 8OCIETY. - IQ view of the Jabilee exhibition of thi mociety next year, and whilat there is ample time for the consideration of the matter, is it not a very pertinent question to ask, Whether a mach more appropriate place cannot be found than the present quarters of the society for ite annual diaplay? It would be difficalt to find a more anauitable spot for the effective diaplay of the flower, anociated as it is with arrroandinge that (to take a very charitable view) are not conducive to the proper enjoyment and critical examiation of the exbibite. The arrangemente (perhaps in some respects unavoidable) were thit meaton bad enough in all concience. What will they be next year with an overflow exhibition, necesaarily incident on a greatly angmented schedule of prizes? I know I shall be met at the outset by
rejoinder, that the Aquarium is a central not, and rejat, from the board of management, the National Chryanthemam Society is treated with a liberality in respect of the all-important financial aspect of the case, that would not be possible elsewhere. Bat, arely, if the National Chryannthemum Society can raise floon for prizes (is sach a sum really needed?) next year as it proposes to do, it can, amongst its numerous-and, in many respecta, wealthyaupportera, raise sufficient for the hire of a auitable hall in a central spot, minus the objectionable curroundinge attaching to its present place of exhibition. I believe that, with a really earnest and determined effort to bring about this mach-to-bedeaired state of affairs, success would crown such endeavourn, the jabiles exhibition would be a red-letter-day in it career, and the National Chryan-letter-day in its career, and themam Society woald secare practical support from anot nimportant namber who at present hold aloof from it by reason of present asiociations. What ay your numerous readers who are interested in the cultivation and populariation of the Golden Flower? and that it shoald have a worthy place of exhibition. Mum.

CARYOPTERI8 MABTACANTHU8.-In the namber or October 26, 1895, "W. W.," apropos of Caryopteria Mastacanthus, writes that probably that shrub will require to be well sheltered daring the winter, ave in any privileged parts of Eagland. In the environs of Paris the plant renists well in pleine terre daring the winter planted a little deeply. I have seen in the late apring some plants of that ahrub that had been forgotten in a border at the preceding autumn cime up strongly. The stems had quite decaved, but the roots had no:s suffored, notwithtanding a co'd in Ghent of \(17^{\circ}\) Réaumar below zero Consequently I consider the plant quite hardy The piant is an excellent bee plant. Daring the esson of flowering from Jaly to the middle of O tober, I hava seen every day thousands of honeybees visit a group of Caryopteris Mastacanthus, and they gave a continual movement to the planta by their going to and fro. It is also an elegant plant for the ornament of the gardens, on account of it long period of flowering. V.A.C., Ledeburg, Ghent.
chaysanthemum aolden weddina. - My experienca with this variety during the present eason enables me to endorse the remarks made respecting it by Mr.W.H. Diversin your lastisane. Like many other growers, uotil this meason I failed to grow it atiofactorily, and felt inclined to discard it altogether ; bat by adopting a difforent course of treatment, I have thia year produced some excellent blooms, measuring 8 inches across by 5 deep. Tae colour of this variety is very attractive, and for decorative purposer one of the best. Cattings were inserted singly in thamb-pots on Dacember 15 last, cool treatment being given from the commencement. The plants were topped daring the aecond week in April, two breaks only being reserved, crown bade being taken. Compont used in potting way of a light rich nature, very little artificial manare being given daring the season. The final shift was to 8-inch pots. H. Warren, Aston Clinton Gardens.

A HEAVY CROP OF POTATOS.-I have been canning the columnt of the Gardeners' Chronicle daring the past few weeks to find the weight of a Potato crop from a given area, which might enable me to form a comparison with the crop grown at this place, the varieties are Satton's Satiafaction and Baraty of Hebron, planted side by side, and each occupying exxctly 2 quare rods of ground. Tae mets of Satton's Satisfaction were planted 18 inches apart, and the rows ware 4 feet apart, and the prodace weighed 6 c 础. 7 lb ., equal to 24 toas 5 cwt . per acre. The tabers were large and of good shape, many of them weighing \(2 \mathrm{lb}, 4 \mathrm{oz}\) each. Baaty of Hebron, planted on the same day, at 12 inches apart, and the rown 3 feet, yielded \(4 \frac{3}{4}\) cwta, or 19 tons per acre. The tubers are of good mape, but not so large as tho of Satiafaction, and the heavient taber weighed \(1 \mathrm{lb}, 10 \mathrm{oz}\). Ours is not considered a good district for the Potato, and this crop is looked apon as exceptional here, although in more favoured localitie it may not bs uncommon. I may add, that these Potatos were planted to illustrate in a small way the advantage gained by giving the plant plenty of apace. T. Leith, Herriard Park, Basingstoke, Hants.

COX's ORANGE PIPPIN.-I have four ntandard trees of this popular Apple, planted eighteen years ago, which this messon produced twenty-weven bashels. They sold for 4s. 6d. per bushel, at they were neither
arge nor well-coloured, and I was ansured that plenty such could be bought for \(3 s, 6 d\). The nett retarna for mine came to \(£ 1\) per tree, bat previously 56 . per tree would be about the amount. The fact is, commoner sorte have hitherto paid best. There is an old tree in my orchard which cropa regalarly in alternate yeara, and which has produced Apples to the value of \(£ 5\) in \({ }^{\prime}\) one season. I believe they are Curltails, a sort no oise would plant now-an extra crop should be alwas rewarded with an extra allowance of manare. Mid Kent.
cyclamen culture.-Cyclamens, under ordio nary good treatment, that is, with due repurd to shading, the supply of moisture to the planta orev. head during hot and drying days with a fine apraying-can, a free circulation of air, the avoidnce of cold draughts, with abundance of water at the rootu, aided by the favourable weather we had in the autamn, have grown into aplendid specimen, The growth, which is always free daring Augat and September, was this season quite exceptional, and not a few of the plants have required shifting from 5 inch into 7 -inch flower-potn. Oar plants have profited by an application or two of weak soot-water, and of the following miztare, viz., two parts Peravian gaano, one part nitrate of potash, one part salphate of ammoaia, and three parts mineral saperphosphate. Tae above ingrediante should bs passed through a very fiae-meibid ieve, in order to get them well mixed tngether Half an ounce of this mixture pat into 1 gallon of water will be anfficiently atrong, and it mas e afforded the plants once a week. It may aloo be applied as a top-dressing at the rate of 1 ck , to ten plants atanding in 5 inch flower-pota; bat the former is the safer method of aning it. The Cyclamen has many valuable properties over and bove the aversge of florist's flowers; it is fres. blooming, has a compact habit of growth, hando comely-marked leaves-which in themselves ought 0 recommend it for houre and table decoration - and the flowering-plant lasts 10 long in the itting room, prodrcing, at it will, a accemios of blcom from Ostober to Nuvember-enough good qualities to pat it in the foremost rank, It was feared at one time, that as the flwern ncreased in size, there would be a decrease is the number of them; but the large-flowering varieties bloom just as profusely at the scall ones, and many of the bloom: have from five to nine petale, and these from \(1 \frac{1}{3}\) to 2 inches in length, and 1 inch broad, with culour from very deep thades of purple ad crimson, rosa and pink, to the pure white A. \(E\) N. George, The Vineries, Milton.
rosa rugosa for game covert. - If not "H. J. C.," of Grimston, Tadcaster, alyly "poking No doabt an acre or two of this beantifol flowering plant or shrab would have a fine effect, eapecislly when in bloom, and the growth had attained nome 5 to 6 feet in height, and would also provide ahelear for some kinds of game; but how about the doge and portamen that had to drive and get them out fa have a vivid recollection of pabing through fa 2b \(^{\circ}\) bushes when rabbit-shooting on the south Domil, and also remember the difficulty of getting the dogi to enter at all where the farze was thick; and the half-blinded atate of some of them from the thom driven into their flesh and eyes as they daund after their game. But this, I take it, would b arpassed by the thorny barrier of Rona rugoss; s least, I think and if such covert was at all high and dense, I for one would forego the pleasure of abootin. among it, and not risk my dogs' eyes by tarning in any that I cared for. Lat any one try a fow houn in a bramble covert, and then possibly they w like get a small idea of what Rons rugona would bo -when it was Rose rugosa, and nothing bat bow with good effect, and Berberis aquifolia emplo food for the birds; but the morries beantifal covert, to m thinking, is that made by the Rhododendron. Som forty years ago, I a one of about 4 acres at Lord Darby's in Knowaley Park. Tae iheltar Whal gove and dry under the rich dark green-coloured colow and then the wesith of bloom in vared forgotel was a sight once seen could never be forgotest It was lovely; the phessants cowered benes and the rabbit cattled here andail, sll adde now and then a moorten or a landraild have been ife t) the scene, but even this wo few "roostiv" trees," auch as Aties or Pinev. For my owa parth do not think any thrab eo fall of thorns Row Rose rugos, or even our own benatiful Dog Raw

S weet Briar, does for, or would make a good edjoyable covert, by reason of their protective tborns, which are both numerous and tharp. Harrison Weir.
- In reaponse to your correspondent's onquiries regarding the above plant as a suitable ence gained here with it in not satiufactory, the rabbits eating the bark off to the height of about one foot, the branches thereby dving off to the ground level. They seem to prefer Laurel, Berberis, and Holly, but Rosa rugose is not exempt from their attacks. If "H. J. C." will kindly give the names of few plants he has found to be rabbitnuonf, II should be greatly obliged. L. Pope, Carlton Hall.

I fear "H. J. C." will bs disappointed with the above anmed Rosa for game cuvert. Three jears ago I planted everal hundrede, thinking it would bs proof againat the ravages of that troublesome little creature the rabbit, but no sooner had they been planted than the tipa of the shoot were bitten off, and they have kept nibbling at them ever since, until only a few miserable tumps remain. A bed planted two jears ago and protected with wire-netting, is now over 3 feet high. It commenced flowering early in June, and continued flowering until the frat of the heps were quite red, and was admired bv many. \(G\). Duncan, The Gardens, Letham Grange, Arbroath.

A CODE OF JUDGING. - If Mr. Patteraon will wait but a week or two, he will have an opportanity of obtaining a copy of the code of jadging which the comoittee appointed by the Cunacil of the Royal Horticultural Society for the purpose have prapared, and which in now in the printer's hands. Whether when published it may bo found capsble of satisfying all requiremente, remains to be seen; but the committee have devoted many aittings and much time and labour to ite preparation. Presumsbly, it will bo insued in pamphlet form, and at a cheap rate. I trast everyone intereated in the subject will secure a copy, and assiat, so far as possible, to make the code recognised as the best exposition of exhibition law. A. D.

The case mentioned by Mr. Patternon, p. 653, seema to have baen due to the bad judgment of the committee in appointing a jadge who did not know his daties. Codes of rales would be of no use to such a person; a good judge muot have a practical acqusintance with his work, especially in the case of vagrtable and fruit, and such persons are within reach of every horticultural society in the kingdom. When a man has grown thinge intelligently for a few years, he knows where to look for the weak points. and eapecially if he has been an exhibitor \&lvo. W. H. Divers, Belviir Castle Gardens, Grantham.
eulalia japonica.-I should like to know if it is unuaual for Eolalia japonica to flower? I have several large clumps which have been in my nursery for at least ten years, which have never flowered till this year. I am aurprised this plans is not commonly cultivated, as it makes a very handsome clamp, and more eapecially when carrying it long plamen of inflorescense. I find it to be mach hardier than the Pampas Graes, the severe frosta of last winter not affecting it in the least degree. C. Cundy.

THE COW PARBNIP (Heracleum Sphondylium), -I Was mach surprised a short time ago by seeiag this plant caltivated by a friend of mine who has about one acre of it, and to hear of the large quantity of green food that it prodaced. My friend tuld me that ha had two heavy crops last year, and after catting
is onca this year, he was lettiag it run to eeed. I is oncs this year, he was letting it ran to seed. I bast treated as a biennial. I ahould be glad to have the experience of some one who has caltivated this plant, and if it may bs convidered good food for cattle. My friend seems to think it an excellent food. If so, I woader that it is not commonly caltiTated as fodder. I know rabbits and pige are partial to it. C. Cundy.

QAB-LIME AB A MANURE.-I note with some interest what Mr. John Lambert states in reference to the use of gas-lime as an antidote for clab in Cabbages, and for the extirpation of wireworm. In lecturing to cottage and allotment-holdert, many complainta are mada an to the ravages of the wireworm, and the occurrence of clubbing in Cabbages and Canliflowern. If I anderatand Mr: Lambert rightly?
he recommend the use of gat-lime in a crude atate, just as it comes from the gasworks. It is true that he recommends its application in very emall proportions, but I have met with allotment-holders who have applied it to their land just in the form in which it is received from the work, and then foand it very difficalt to grow anything on the land for a year or two. It is no doabt a aseful agent, deatructive to insect-life when used as recommended by Mr. Ismbert; bat my fear is, lest some might pat too large a constraction apon his words, and apply it unwisely, and with unfortunate effecte. Mr. W. G. Watson. in his admirable paper on "Manares and their Uses," tells us that gas-lime "is a mixture of calcium hydrate and calcium carbonate, with sulphite of lime. The two latter compounds irs in themseves poisonous to plant-life, but they are both converted into gypam or sulphate of lime (a plant-food), by exposing the gar-lime to the action of the atmotphere." It may and, I fear, does happen, that when gat-lime is applied in a crade atate as received from the gasworke, the two c mpoands, poisonoas to plant-life, are present in undue proportion in the interesta of safety, hence the unfortunate reanle which I have heard allot-ment-holders deplore. Mr. Watson further atatea: -"To prepare freah gas-lime for use in the garden, it may be epread out on a layer of pondmud, night-soil, or coarse vegetsble refuse, end exposed to rain and air." This I hold to be sonod and necoseary advicp. If pat on cleared land in the autacon, it can be laid apon the surface at the rate of 40 lb . or so per rod, but it should lie on the surface for everal weeks before being forked in. taking care that it is distribated equally through the soil. It is undoubtedly a powerful remedial ageat in clearing land of insec: life, bat neede to be applied with caution. R.D. [It is doubtleas asfeat to use gas-lime after some weeka' exponure in the open for sarface-dressing, or when applying it to land dag to one apit in depth; but in the case of dressing the bottom woil in trenching and incorporating with the top pit, which is utaally thrown iato the bottom of the treaches in the small quantities recommended by Mr. Lambert, no harm, but rather good, would resalt from the use of gat lime in the fresh trate. Eid.]
packina competition at the crybtal PALACE.-Possibly no fresh light may be throwa now apon this sabject, but I am disposed to agree with "Oae of the Jadges" in his romarks anent the wame. If a practical gardener who has constantly to pack his produce is not capsble of judging in anch a case, I do not know who is. Some few years back at Chis: wick the judging was done by the froit committeo and othera there present as a body. That was certainly not so satiefactory as at the late show, from the aimple fact that some of those called apon to adjudicate had no practical knowledge of packing fruit for trannit as per schedule. Had it been otherwise the premier award would not have been made to oae of two boxes entered for two classes, these being sent tied together. Ia this way the larger one, by reason of its aize and waight, wat a protection to the smaller and successial one. Ia this respect I cannot agree with Mr. Harris, who fails to see why disqaalification should follow because the entries in two clasies were sent tied together. Most assuredly it should do so, and the jadges did quite right in thusuing their powers to dirqualify an exhibit. Ia packing for market, moss may be, and no doubs it, one of the best packing mediams, bat it does not follow that It in mo in every case. Perionally, I consider wood-wool preferable, from it freedom from dust, and it certainly is more cleanly in appearance ; whilst in regard to apotting being caused by its use, there need be no fear, if the fruit doen not remain packed after arrival, which in private use would not be the case, although in market use it might do eo. It is not the fault of the jadger if the achedule be not anfficiently explicit for intending competitors. In giving their award, they must interpret it to the best of their ability, and intending exhibitors ahould do likewiee. I inspected the echedule bofore the late show was held, with the intention of entering in the class for Grapes; but upon consideration I decided not to do so, simply because the wording was, in my opinion, somewhat vague. It certainly afforded a loop-hole for those who were disponed to take advantage of it, of bringing the fruit themselves. This han been done I know, but it should not be allowed. In this respect I am at one with Mr. Grindrod. In my opinion there should be classes for market as well at for privato packing in thene competition. A Prize Packer.

\section*{SOCIETIES.}

\section*{ROYAL HORTIOULTURAL.}

\author{
Sciontific Committee.
}

Nov. 26.-Present: Dr. M. T. Mesters (in the chair): Mr. Michael, Protessor Müller, Dr, Bonavia, Ber. W. Wilk, and Rev. G. Hendow. Hon. Sec.

Flies Attached by Fungus, - With referonce to the apecimens exhioited by the secretary at the lart meeting. it was reported from Kew that "the fungus is Empute culicie. A Braun (Alg. U'ncoll, gen.0 Nov, p. 105). It is comman in various parta of Rurope, aloo in the United 8tates, but not provionaly recorded for Britain." The apeoimea was propared by the inte Proteser J. S. Henalow in 1840.

Apple Diseased. - The black-ooated Apple brought to the last meeting proved to be attecked by Bclerotinis fructimena Rehm. (Krypt. Filora, Discom.o p. 67). The minute bleck Iumps on the Apple are the solerotia of the fungu, from whict the asciecrous Peziza form grow?. Negligence in epraying during the spring season, when the fungas is on the leave only, accounts for ite presence on the fruit.
Cocos Fouits.-The fruite exhibited at the lest meeting proved on further inveotigation to be of C. eriospatha, and not of C. australi', as suppored.
Carnations Attacked by Grubs.-Proleseor Maller exhibited a number of weovil like aruba which attacked the roots of Dianthus olusialis, completely destroying the stem, so that the upper part became detachod. They were forwarded to Mr McLachlan for examination, who has reported that they are probably those of Hylemyia nigressens, of the group Anthomyiidee of dipterous insecte.
Vine Stems, Malformed. - Dr. Masters exhibited portions of Vine stease witb hypertrophous growths of a tumourous appearance. There did not appear to be any fungus, but they consiated of new cork and wood only. Similar appearance had been sonn on Maréchal Niel Roses. It was probably due
to some injury, perhaps frost, with a subsequent eff Jet to to some injury,
Hybrid Abies.-Dr. Masters also showed a branch from a hy brid between Abies Pinsapo (female), and A. cephalonica (zale) An intermediate character was seen in the position of the resin capal, in that while in A. ceph. it is situated adjuining the epidermis and in A. Pins. it is more deoply seated, in the hybrit there was one layer of colls between the canal and the epidermio. The general form and habit more nearly rosembled \(\mathbf{A}\). ceph., whate the otrorg branches and thick loat approxicated 4 . Pine. The cones, however, with very visible bracts, were thoss of A. cepls.

\section*{EXETER GARDENERS' AGSOCIATION}

NOV was held in the Guildhall on the above date, when there wa a mood attendance. Mr. Hill, market gardener, Whipton. cocupied the chair. The business of the meeting was a discussion on Judgiag at Flower Show, Mr. Bowland, gr. to W Breck, Keq, of Parker' Well, leading by a well-thought-out paper.
Mr. Rowland, in the course of his remarks, alluded to the difficulties that could not well be svoided. When a judge begna his duties, he then, perhaps for the first time, got the echedule put into his hands, but unless he rad carefully con sidered it before beginning his work, he was liable to fall into orrors arising out of the special conditions of competition in the various classes being sometimes carelesely expresed. The oecasional necessity, according to the wording of the schedule. of diequalifying an exhibitor, led to disatisfaction, and the mal contents airing their supponed grievances, made things pretts unpleasant for the judge. In the neoesarily limited time al lowed for making the awards, points, apparently trivial, bat really important, were overlooked, and, igaoring the hamperisg surroundinge, the critics pounced upon any emall discrepancy. and railed against the judges. He, therefore, thought there ought to be one or two referees to follow and check any oversight on the part of those who were responsible for making the awards, so that the error might be there and then cor rected. As regarda Chryannthemums, it was difficult to com pare a large showy bloom with a more refined and equally meritoriousflower, though the latter might enffer in com parison as regards size or out ward attractivenose. To remedy this, be suggested that in a class of, say, thirty-nix blooms, twenty should be named in the schedule, then flower for flower of the same variety could be compared and edjudicmted upon.
A long discuseion followed, taken part in by Meews. Protheroe (Beaufort House), Weels (Stoke House), Lensdal (amateur), Carlyle, Hope, and others.
The mociety settled the arrangement of their schedule for their spring show, to be held on March 18, and also agreed to the annual mupper of the society being held on the first Iriday in January.
A vote of thanke to the chsirman, and to Mr. Rowiand for introducing the discumbion, wee pased.
Mr. Ontram, who hae travelled in the borticultural intereat for over twenty years in the United States, prowised to give paper in the epring on "The Progree of Horticulture in America." The paper for the neat fortnightly meetiog wes anounced, being one by the Dowager Countees of Morley' gardener, the rabject "Wild Garenoning, nad the Loyivg-oat of Pleasure Grounds."

\section*{CHESTER PAXTON SOCIETY}

November 19, 20.-The annual Fruit and Chrysanthemum xhibition was held in the Town Hall, under the auspices of the above society. This is the fifth exhibition which the ociety has held, and the entries each year have been better than those of preceding shows ; on the present occasion, they were twice as many as last year.
Over 1,200 dishes of fruit were exhibited, consisting of Apples and Pears, whose superior quality was apparent at a glance; and the excellence was quite general.
The competition was very keen in the classes for Ribston, Cos's Orange, and King of the Pippins; and for kitchen arieties, it was even more so. Peasgood's Nonsuch, Alfriston, Mère de Ménage, Blenheim Orange Pippin, Warner fruits of and Wareham Russet were extensively
the first-named variety being very fine.
The exhibition has, from its commencement, found much tavour in Cheshire and North Wales; and competent judges now say that it is one of the largest exhibitions of hardy fraits held in provincial towns.
Pears were largely shown, and splendid oxamples of Louise Bonne of Jersey. Marie. Louise, Pitmaston Duchess, and Doyenné du Comice, were noted,
Although this was the second ocoasion when the society has offered prizes for Chrysanthemums, the entries were fairly good, there being siz competitors for decorative groups. Most of the elasses for cut blooms were well contested, and the majority of the Japanese blooms were excellent. A notable feature was the keen competition in the class for the bestarranged bor of cut blooms of single-flowered Chrysanthemums. In the gardeners' class for fruit, the chief prizes were carried off by Mr. E. SEVERN, gro, Combermere Abbey: Mr. J. SAUMDERSON, gr., Bodnant Hall, Denbighshire; Mr. Worker, gr., Mollington Hall; Mr. John Taylor, gr., Hoole Hall; and Mr. Thomas Weaver, gra, Christleton Hall.
\(\Delta\) very fine collection of Apples and Pears, not for competition, was sent by Mr. Blraves, gro, Eaton Hall; and Messrs. Dicksons had also a tastefully arranged stand of hardy fraite, Orchids, Ferns, \&c. The Duke of Westmirster in declaring the exhibition open, threw out the hint that a very cood summer show might be established at Chester; and offered to help and suppliement any effort that might be made in this direction. The whole of the arrangements were ably carried ont by the Committee, with Mr. G. P. Miln as Secretary.

\section*{NATIONAL CERYSANTHEMUM.}

Drcimake 3, 4, 5. -The last show of the jear by the National Chrysanthemum Society at the Royal Aquarium lormed a fitting finale to a very successful season: Ravely has the quality of the exhibitions been so high as during 1895. Commencing with the early autumn show, the blooms exhibited on that oceasion were remarkable, and we wondered if better ones would be seen in November. In due time the excellence of the great annual show was acknowledged by all, and on the present occabion the Society may well be proud of the display made, for never has there been a finer collection of blooms shown in December than the 1st prize eshibit of twenty-four Japanese in oightoen varieties, from Mr. A. Hhegart. There was no class for groups at this late show, but the enterprise of the large growers was manifest in large miscellaneous collections of plants and flowers, very creditable to them. Cyclamens and Primulas added a little rariety, and made the show more interesting. As the whole of the floor space had been appropriated to the ladies' bicycle races ! the entire exhibition was held in the galleries.

\section*{Cut Blooms.}

As we have already stated, the let prize in the principal class for cut blooms of Chryeanthemums was taken by Mr. A. Haggart, gro to Mrs. Joneveron Foster, Moor Pary, Ladlow, who secured other valuable classes also. It may be interesting to give the variotive he staged in this clasa. They were Eitoile de Lyon, Kd. Molyneux, Niveum, Duke of Tork, Golden Gate, Mra. Harman Payne, Mdlle. M. Hoete, York, Goiden Gate, Mra. Harman Payne, Mdlle. M. Hoete,
M. Pancloucke, Lord Brooke. G. O. Sch wabe, Madame A. Moulin, Mra. W. H. Leew, Le P. du Boin, Viviand Morel, Beasty of Cuatiowood, Internationalo, Hobert Owen, and Mdlle. T. Rey. The and place wae taken by Mr, Henry Perrins, gr. to W. H. 8MrTE, Eeq.. Greenlands, Henley-onThames, in whose stand were!good blooms of Madame Carnot, Golden Wedding, and Primpose Loague. 3rd, Mr. W. Mease, gr. to A. Tate, Eqq., Downide, Leatherhead. There were oight exhibits.
Mr. Perkiss occupied the best position in the following clase, which was for twenty-four bunches of Chrysanthemum blooms, of any varieties ; 2nd, Mr. Jno. Aplin, gro to W. M. Baker, Reqq.o, Hasfield Oourt, Gloncester: 3rd, Mr. C. J. Waite, gr. to the Hon. W. P. Talieot, Glenhurst, Reher. The whole of the exhibits in this class had not the tasteful appearance the conditions were intended to encourage. In most cases the stems should have been loft longer, and varieties selested with good atout atems and erect flowers. The blooms ne they appenred in recoptacies sumilar to blackingbotties, had falleo, asd were huddied together in any thing but sa elegant manary, and were objest lesous is how "not to srrange a rase."
The best exhibitor asaong tan of twelve Japanese bloomas, dishaot, \#h Mr. Hugeasers, Dunflowar and Golden Gate wore noticeable in his collection: 2nd, Mr. W. Memenger, ge. to O. H. Beimerrs, Eeq., Woolvoutione Parl, Ipswich; end sid,

Mr. Jno. Aplin, Mr. HagGart won again in the class for gir blooms, "among ten or more exhibitors.

The principal class for incurved blooms, was one for twelve blooms, in not fewer than six varieties, and the quality of the exhibit was decidedly batter than we had expected would have been the case-1st, Mr. W. Neville, gr. to F. W. Flitert, Esq.o Cornstiles, Twyford, Winchester. The best blooms were Lord Alcester, Mrs. R. C. Kingston, Chas. H. Curtis, and a seedling ; \(2 a d, M r\) A. H \(\Delta G G \Delta R T\); and \(3 \mathrm{rll}, \mathrm{Mr}\). Jno. Aplin.
In the class for six blooms (incurved), Mr. H. Perkins was the beet exhibitor ; and Mr. W. Neville followed.
Another clas for bunches of blooms was arranged for twelve bunches of Japanese blooms, in not fewer than six varieties. None of these classes was satisfactory, although some of the blooms were of good quality, 1st, Mr. R. C. Notcut, Broughton Road Nursery, Ipewich; 2nd, Mr. H. Alderman, gr. to Gillilat Hatrield, Esq., Morden Hall, Surrey ; 3rd, Mr. S. J. Cook, gr. to T. H. Harbridge, Esq, Holmewood, Hendon, A similar class for six bunches was won by Mr
CrAWFORD, Gatton Park, Reigate.
The single flowered classes were pretty. The best collection twelve bunches of large-flowered varieties was from Mr. G. W. Forbes, gr. to D. Nicous, Esq., Regent's Houss, Surbiton, W. Forbes, gr. to D. Nicols, Esq., Regents Eens., Ésq., The and Mr. W. C. Pagram, gr. to J. Courtenar, Esq., The
Whim, Weybridge. Mr. A. Felgate, gr, to Her Grace the Whim, Weybridge. Mr. A. Felgate, gr, to Her Grace the Duchess of Welingeror, Burhill, Walton-on-Thames, had the
best collection of twelve bunches of small-flowered single varieties.
\(\mathbf{M r}_{\text {. }}\) T. Tullett won in the olase for sir bunches of smallflowered single varieties, and the one for siz bunches of largerflowered ones.
Amateurs.-The amateur showing best collection of six Japanese blooms distinct, was Mr. H. Love, 1, Melville Terrace, Sandown, Isle of Wight. The best exhibit of a vase of Chrysanthemum blooms was made by Mr. D. B. Crane, 4 , Woodview Terrace, Archway Road, Highgate, whose arrangement of moderatesized blooms, including some single ones, was praiseworthy. Mrs. W. Green, jar., Harold Wood, Essex, was 2nd.
Miscellaneous Plants.-The best collection of Cyclamens in pots was from the St. George's Nursery Company, Hanwell, who had a very large table filled with plants, among which were interspersed a few foliage plants. 2nd, Mr. J. F. McLeod, were interspersed g J. P. Morgiv, Esq., Dover House, Roehampton. In the gr. to J. P. Morgan, Esq., Dover House, Roehampton. In the
centre of Mr. McLeod's group was a panel formed of Adiantum centre of Mr. McLeod's group was a pane fith a few pretty plants of Crotons and Dracenas. The Ferns, with a few pretty plants of Crotons and Draceenas. The
best collection of twelve plants of Cyclamens was from Mr. best collection of twelve plants of Cyclamens was from Mr.
Mcleod; 2nd, Mr. W. Rapley, gr. to H. Grinuive, Esq.⿻ Harrow Weald House, Stanmore, whose plants were all white flowered ones.
fiowedest collection of Primula sinensis, plants in flower, was bhowd by Mr. A. Newell, gr, to Sir Edvin Saunders, Wimbledon Common, and mixed with foliage plants the effect was pretty; 2nd, Mr. J. P. McGregor, kr. to Dowager Lady HAY, North House, Putney Hill. Mr. A. Newell had the best twelve Primula plants ; 2nd, Mr. T. F. McGregor ; and the best dozen
double Primula sinensis were from Mr. W. Mease, gr. to A. double Primula sinensis were from Mr. W. Mease, gr. to A.
Tate, Eeq., Downside, Leatherhead. A very pretty collection of flowering, berried, and foliage plants arranged on a tabde, space 9 feet by 8 feet, was shown by Mr. W. Eowe, gr. to H. Tate, Esq., Purk Hill, Streatham Common, S.W.

Non-competitive exhibits,-The most important of these was a large group of Chrysanthemums arranged in a bold manner, with supplementary plants with decorative foliage, by Mr. H. J. Jones, Ryecroft Nursery, Lewisham. Mr. W. Welis, Rarlswood Nurseries, Redhill, had a group novel in arrange ment, the bachground being composed of a cork-clad wall with pockets for; Ferns, intertwined Ioy, and such things. In front of this there were between the mounds mossy spaces with trailing Ivy, suspended shower bouquets, \&ec. A large collection of cut bloome ran from the group on either side, and the whole was backed with white cloth. The arrangement would whole was backed with white cloth. The arrangement would have boen more effective if it had neen more boldy carried out. groap of plants in flower of the variety L. Canning, a well-known white one suitable for late decorative work. Mr. Norman Davis, Camberwell; Mr. W. J. Godfrey, Exmouth; and Mr. Robr. Owen, Maidenhead, had each a good representation of novelties, and of the newer but known kinde. Mr. J. R. CHARD, Stoke Newington, exhibited his floral arches, \& \(\mathrm{C}_{0}\). and Measre. Cutbuse \& Son, Highgate Nurseries, had a collection of flowering and foliage plante。Mr. A. Merridem had arranged a dinner-table; and Mr. C. J. WAITE exhibited vegetables in a satisfactory manner.
Mesore. SANxET \& Sons, Bulwell Pottery, near Nottingham, had a large exhibit, representing different varieties of garden pottery; and MP. W. Coxchester, Ipswich, had a displayed exhibit of Ichthemic Guano.

\section*{Floral Committee.}

DECEMBER 3.-A goodly number of novelties was submitted to the Floral Committee, though but few awards were made. \(\Delta\) First-class Certificate was gained by Mrs, Charles \(\mathbb{E}\). Shea, a delicate sulphur-white variety, raised by Mr. C. E. Shea, a fine ant full deep incurving flower of high merit, from Mr. A. Haggart, The Gardens, Moor Park, Ludlow. To decorative Golden Dart, as shown, a small sized deep yellow Japanese, full of promise for cutting purposes, and erpecially for market worl, from Mir. E. H. JEmkxw, Hampton Eim; and to decorative King of Plumes, a small yellow variety with feathered petals, very free and attractive, from Mr. R. OwEN. Other promising flowers which, though failing upon this oceanion to obtain awards, are yet of decided promise, ase:Decorative Jazett's Sheahan, a buef and gold sport from the
blush-coloured Princess Blanche, a large, well-flowered ban plant being staged, from Mr. D. Sheahan, nurseryman, Win. bledon; a aport from the incurved Jeanne d'Arc, of whieh the committee approved, but which they requested to see aghin in
bsiter condition, from Mr. J. TAIT, Lyneho Flight, a seedling white incurved, from T. W, Carlise; \(\mathbf{M}_{n}\) Twyford, Hants, which the from T. W. FLIGHT, Eloq, again; Japanese, Pearl Beauty, a very fine wished to again; Japanese, incurved Japanese, solid, and bath-colourad, broad-petalled incurved Japanese, solid, and foll, from Mr, Kull bright crimson fluwer, with an amber and full bright crimson fluwer, with an amber and gold reveree which the committee wished to see again; this, with other
novelties, came from Mr. R. OWEs, Maidenhead novelties, came from Mr. R. OWEN, Maidenhend; and in
curved Egyptian, from Mr. W.J. GoDFRET, wition then mittee regarded as an incurved Japanese, thestant cmomwith amber reverse.
A new design in flower-pots for large especimen plants of Chrs santhemume, from Messrs. R. SAMKEY \& Soir, Belme Notts, was commended by the committee.

The National Chrysanthemum Society enjoged ita annul dinner on the 27th ulto, when it was celebrated with on siderable enthusiasm at Anderton's Hotel, Fleet Street, one of the homes of the Society. Sir Edwin Saunders (Praident) occupied the chair, and there were present the officars of the Society, and a good number of Fellows. More interesting than the toast list (which was duly observed) was the pressatation of the Medals and special prizes awarded at the recent grat shows, which included the handing over of the two Holma Memorial Cups to Mr. W. H. Lees. The Chairman, in propoiag "The National Chrysanthemum Society," gave an interestiang description of some of the political and social featumes of China, as the country to which we owe the introdection o the Chrysanthemum

\section*{READING AND DISTRICT GAR DENERS MUTUAL IMPROVR. MENT ASSOCIATION.}

DECEMBER 2.-The fortnightly meeting of the above ano ciation was held in the Club Room at the British Workman on Monday evening last, Mr. Woolford presiding oret the largest gathering of members present at any of the meting this season.
After the usual business had been disposed of, and a ler introductory remarks from the chairman, Mr. E. J. Dehrid Mesbrs, Sutton \& Son's gave a highly interesting leotare on - The Garden Pea and its Varieties." The lecture was mado doubly interesting and instructive by the many excellem diagrams prepared by Mr. DEAL, setting forth the pecoliarition and variations of the shape of pods of the varions typu of Peas.
A very interesting discussion took place, in which Meers. Woolford, Lees, Hinton, Burton, Tubtor, Deariorg, Bowie, Tugrail, and alexander took parto Many quas tions were asked by members present, which the Lecturer ably answered. On the proposition of Mr. LeEs, seconded by 1 lr Neve, a hearty vote of thanks was passed to Mr. DELI, ad the wish expressed that as the subject was of much interest he would again take it up on a future occasion.

\section*{TREATMENT OF TREES R CEIVED DURING FROST.}

I was seaking recently to a friend on the above subject, who pointedly remarked that "thowo who know their business send their orders early, and ail not troubled about receiving frozen trees." WN mont of as are familiar with the advantages to bo derived by mending early ordern. Neverthelem, for easont over which we have no control, we nut time receive trees that are frozen, and then the queation arises, what is best to be done with them! Several instancea have come to my knowlodge o trees, \&c., received in this condition, being trented in a way (and that too by men commanding gool positions as gardeners) which, when described, wh appear incredible. A case referred to was that of some Peach trees, which on arriving at their dentims tion, were found to have their branches and rook frozen through. They were at once anpacked, their branchea conaiderably mortened, and rook trimmed, and then planted in two where border had been prepared for them; mand over, to make mattern worse, the pipes were whu in order to thaw the trees! I asm these treot following autumn, and noticed they ware ven mat gummed, and that their branches had died buch wa ntems, from which, however, young wis was made-how these treas ultimatioly case refers to some Apple treen, which, wher fo ceifed in a similar ataie, were unpacked laid in a outh border, where they man thawed by the aun. They were sabsec nid planted, but rome of them cankered, ani
did well-in fact, they becsme an eye-nore and were burned. Another case wan that of some hundreds of Yew treez, which in tranait by rail were much frozen. These, on reaching their destination, were thawed by warm water, and the following epring, after they were planted, nearly half of them were dead. Farther deacriptiona apon this line of mismanagement woald be irksome; I will therefore turn to mome cases of nuccessful treatment. The first of these refers to a number of bundles of ahrubs and Coniferm, which, when received badly frozen, were placed in a cool cellar, where they remained until a natural thaw took place, after which they were planted in their permanent places, where, with very few exceptions, they grew well, and were in every way estisfactory.
The following are particalars of a case that occarred here lat winter, and refers to mome dozens of Apples, Plams, Guoseberries, and Carrante, which were ordered late for some new cottage gardens. These left a nursery on January 25 (the day the mevere frost set in), and throagh an overaight, did not reach here for several days, when they were severely frozen. They were in bundlex, surrounded with atraw, which was not removad. For want of a better place the bundles were stacked together on the floor of a north shed, and covered with a thick layer of dry litter, where, owing to the frost, they remained until some time in March (I do not recollect the date) before they could be planted, at which time, to nay the leat, they did not look promising. I have watched the progrens of these treen and buahes with considerable intereat, and noticed that only four died (excepting an Apple, which was killed through' being barked by a rabbit); and thene were Victoria Plums. The Applen have made good thort jointed growths, and aeveral of them blosnomed freely and bore some good fruits, as did also the Gooseberries.
The above remark on varioas modes of treatment may be at least a guide to the uninitiated how to treat and how not to treat trees, \&c., when received in a frozen condition. They prove that artificial thawing is disastrous, and that the only wafe course to take is to leave the plants in their packagen, keep them from air in the dark, and safe from further frout, until they are naturally thawed, when, an the first opportunity offers, they whould be planted. Thos. Coomber.

\section*{The Herbaceous Border.}

\section*{AISTRGEMERIAS.}

The prement in a good time to plant any of the hardy varietien of these uneful plants. They are nerviceable an cut flowern, embracing some very atriking hades of colour, that the flower are alway welcome, and not the leat point in their favour in that a foot or more in length of atem is readily obtainable when auch in needed. Of nome importance in their succenfal cultare is the aelection of a auitable ponition, where there is no fear that the plantil will be disturbed. A south or south-west border anits them, but they may be planted in other positions. It is not advisable to mix them with the usual occupant of the herbaceous border, for they are apt to travel about by means of underground items. An important matter is to plant them at a a afe depth below grouad, so as to be afe from injury by frost. For thit reason they thould be fully 6 inche or 8 inches below the sarface. At the latter depth they are parfectly asfe, even in our most severe winters. At planting-time remove this depth of top-toil from the bed, then add a liberal dressing of rotten manure, and dig it into the aub. avil. Roughly level this off, adding a layer of sharp river and, then lay the tuber on thia bed at a few inches apart. In this way a large number of roots may be grown in quite a mall opace, and a good display of flowers result. The varieties beat saited for this are aurantiaca, the form: of chilenais, and paittacina. For ite intrinnic worth none perhapa is nearly so valuable in the outer garden as the first-
nsmed. There is, however, a singular variety of colour, as almo in pictureque character, in the varying forme of chilensis; and benides, these latter are earlier to bloom, and have their own apecial value on this account. J.

\section*{Gbituary.}

LADY LAWE8.-It ie with deep regret that we record the death, at the age of 73 years, of Lady Caroline Lawen, the wife of Sir John Bennett Lawen, Bart., of Rothamited, who expired on Friday alternoon of last week (the 29 th alt.), after a comparatively short illneas, at their Scottish seat, Ardchallan Priory, Lock Etive, Argyllshire. The body of the deceased lady wat conveyed to Harpenden, and interred in the parish churchyard on Taesday lat.

\section*{Trade Notice. \\ FAILURE OF A SHROPSHIRE SEEDSMAN AND FLORIST.}

The failure is announced of Mr. Robert Porter, meedaman and florist, of The Croms, Oawestry, and of the Rose Hill, Whittington, and Fron Selattyn Nuraerien. The atatement of affair ahow the gross liabilities to be \(£ 373658.9 d\)., expected to rank \(£ 1700\) 15s. \(9 d_{\text {., }}\) and assets \(£ 263312 s\). 1d., leaving a arplus of assets of \(£ 932 \mathrm{16v}, 4 d\). The debtor alleges as the cause of failure, ill-health for the last four jears, general depression in trade, keener competition, and difficulty of collecting accounts. The official receiver points out that the receiving order was made on a creditor's petition. The debtor intends to offer a composition of 20 s . in the pound. He own the freehold property, 6, The Crons, Oswestry, valued by him at \(£ 1500\), and the Rone Hill Naraery, Whittington, valued at \(£ 2000\), and it is from the value of these propertien that the surplus of astets is shown. Liverpool Post, November 22, 1895,

Mesars. Mesgengra \& Co.. horticultural bailders and hot-water engineers, have removed their baninens operations to extenaive new premises recently erected, close to the London \& North-Weatern railway atation at Loughboro'. The new buildinge occapy a aite 2 acrea in extent.

\section*{CORN.}

Averages. - Official atatement of the average pricon of British Corn, imperial measure (qr.), for the weelr ending November 30, and for the corresponding period in the previous year :-1895: Wheat, 25s. 2d. ; Barley, 24s. 7 d. ; Oats, \(14 \mathrm{~s} .3{ }^{2}\). 1894 : Wheat, 20s. 7d.; Barley, 22s. ; Osts, 14s. 3d.

The term "accumulated temperature" indicates the aggre sate amount, as well as the duration, of degrees of temperature above or below \(42^{\circ}\) Fahr. for the period namod: and this combined result is expressed in Day degrees - a "Day-degree" signifging \(1^{\circ}\) continued fo twenty-four hours, of any other number of degrees for an inveraely proportional number of hours.]

The districts indicated by number in the efst column are the following:

THE PAST WEEK

THE follo wing summary record of the weather throughout the British Islands for the week ending November 30 , is furnished from the Meteorological Office:-
"The weather was almost continuously dull over England and the east of Bcotland, with a great deal of mist; over Iroland and the west and north of Scotiand the aky was frequently clear-sopecially during the earliep half of the period. Fory littlo rain fell in sny part of the Kingdom natil the middle of the week, but from that time the falle were frequent, and is some places rather considerable.
"The temperature was rather low during the earlier part of the period, but subsequeatly rose, and gradually became high for the time of yeer. The average vilues for the weel were concequentiy agaic above the normal, the excess ranging from \(1^{\circ}\) in moat of the waters and north-wentern districta, to \(3^{\circ}\) in the north-cast, eant, and sauth. The highest of the maxima ware recorded towards the end of the wenk, and varied from \(58^{\circ}\) in the "Charnal Talands, and \(57^{\circ}\) in "England
8.W. and Ireland, S., to \(49^{\circ}\) in 'England, N.E.' The lowest of the minims occurred either on the 24 th or 25 th, when thes ranged from \(23^{\circ}\) to \(30^{\circ}\) in Scotland, from \(28^{\circ}\) to \(27^{\circ}\) in Ireland, and from \(29^{\circ}\) to \(33^{\circ}\) over England. In the 'Channel Islands,' the lowest reading was \(37^{\circ}\).

The rainfall exceeded the mean in "England, 8. and the Midland Counties' and just equalled it in 'England, E. I ll districts there was deficit. that in 'Scotland, N all other districts there was
"The bright sunshine was very deficient over England and the east of Scotland, but exceeded the mean in Ireland and the north and wes: of Scotland. The percentage of the possible duration ranged from 33 in 'Ireland, N.,' and 30 in 'Ireland, \(\mathbb{S . , '}\) and from 21 in 'Scotland, N.,' and 20 in Ecotland, \(\dot{W}\). and the Channel Islands, to between 10 and over the greater part of England, and to 1 in 'Scotland, E,'

\section*{Varlorum.}

Chrysanthemums Grafted On Anthemis. -I have lately noticed, at the Cbâtsean of M. Jean Everaerts, Mortael, Antwerp, four Chryanthemam grafted apon Anthemis stock; and the following are the dimension of these planta, and the number of the flowers:-

\end{tabular}

\section*{Ch. De B.}

Evolution in the Chrysanthemum.-Mr. Martin White's suggestion to the gardeners to atudy evolution in the Chrysanthemam is one which they ought to find particularly easy and pleasant to follow. Nobody know with absolute certainty the natural species from which the vat number of forms of the flower at prenent known to horticulture have sprung. The Japaneas atock on which we have worked was already modified into shapes and hues correspondent with the dainty taste of that people when we began operations upon it. Bat nothing ia more certain than that in the Chryannthemam the gardener possesses a flower of unequalled mobility, whether he attempts its modification by means of hybridisation, or by the better, if slower, mean of selection. Nor is it to be apposed that the scientific interest in the process is exhausted by the fact that countless varieties of blooms have already been produced. It is a remarkable thing that hitherto variation bas followed taste with what might almost be called docility. In Japan taate is prim and neat, or nothing-the Japanese Chryaanthemum is prim and neat. The elimination of the unprim has been, of course, a prime element in the process. In this country the taste in for variety, and even extravagance-and the docile Chryanthemum is most varied, and an extravagant an could be wished. Bat in both countrie tate, concerned entirely with the bloom, has ignored the calyx, and under the mot fantastic of flowers the observer may atill see the unchanged calyx of the natural plant, hardly differing, eave slightly in the morphological regarda demanded by the increased weight of the floral atructure, from the calyx of the wild Chrysanthemum common to the Scottish fields. Will any gardener, to whom experiment is dear, try his hand at the modification of the caljx? And, by the way, har any gardener ever tried to "improve" the wild Britioh variety referred to? Dundee Advertiser, November 21, 1895.

Amprican Phasts: A. J.B. Naturally, you ahould apply to the addrens givea in the advertisement, viz.:-Harland P. Kelsey, Higbland's Nareery, Kewans, Michell County, North Carolina, U.S.A.

Books: C. W. No Gardener will give you ju the kind of information required.-T.G. B. Cul tivated Plants, by F. W. Burbidge, published by Blackwood, London; an excellent book by met with only at second-hand book-ahope J. D. B. My Gardener, by H. W. Ward, pab liahed by Eyre \& Spottiswoode, Eat Hardio Street, E.C.j Vines and Vine-culture, by A. \(\mathbb{R}\) Barron, pablished at 171, Fleet Sireet, E.C.

Cinkrarias, \&c., with Drops of Watrr on fre Lizap. exate: \(J . A\). The renult of exudation from the leaves in the case of plants standing in rocently. watered soil. There is some amouts of sbrortion of moisture by plants not in a gorgat condition, but not by others.

Correction: Re obituary notice of Richard Gilbert, - We are requented to atate that the late ganduar at Barghley House was not the tenant of the garden, as atated in our notice of his lifo, bas continued to be head gardener to the lath.

Croton Leaves Injured: M. R. Morgan, The damage to the Croton leave may arise from tho ill-effects of team from the hot-water pipen; or if the pipes have been re-blacked, from the ataff used in colouring the pipes. Some are anmin enough to use gas-tar for this purpone, and the results of this may be witnensed for years aftero warda. Sometimes an untrapped drain in tho house will cause similar damage. In fact, there are numbers of ways in which the minchief might arise, and which would be eanily determinable if we were on the pot, but not easy for an abreateon to point out.
Dressing for Vines: C. S. If you carefully real our "Fruits under Glass" Calendar in Gardewry' Chronicle for November 30, you will find jut the mort of information that you require.
Flora of Domfriesshire: J. K. You shonld advertise in our colamns; or enquire of some Scon bookseller.
Fruits, Seedling: Jino. Barnett. Your eeedicg Apple is fairly good, but not superior to may others in caltivation. The Pear seems to distinct, and well worth cultivation. Wo cha find no trace of the name "Auguste Mignamd." Your photograph shows that an excellent crop has been borne by the tree, and it has been viry akilfully cultivated.
Ivx: L. P. We do not auppose that Iry of ary plant is banefited by having ite leaven cul of, will tidy gardeners cut the Iry that covers their will close to the wall almost, so that the folisge andil have a neat fresh green appearance, and not, oming to its weight, pull the ontire plant to the ground, an it otherwise might do.
Kew: \(F\). W. If you will enquire of the Direther, you will be farnished with fall partiellan regarding necesary acquirementu, \&c.
Mariet Annuals: W. \& S. These are fer too numeroua for as to give a list in this place, bed we will mention a few. Drarf Namartinman in good diatinct colour, Coreopsis vart, Carjearther mam Barridgeanum, C. carinatum, C. triedor, Gyeophila paniculata, Reneda odorata (Migroo nette). Ten-week and East Lothian Srockh Petunias, Verbenas, Zinnias, Aatera, Sweet Salma various Globs Amaranth, Balsams, \&c.
Manore for Light Dry Land: J. L. A. Whatom manure is applied should bo well-decajed ad rich, con and pig-dung answering bettor then that from the stablem alone. If you could parm come sheep on the land, say, from forty to nisy animale, on half-acre patches at a time, foedibut them with oil-cake, and Swedes, of Tarniph they would consolidate as well as enrich it. drainage-water from the dang-yard blouid eaved and distributed over the land in tho boore it The land should not be ploughed or dug fation is required to be planted, as much of ther liedt properties of the manure is soon lost in vers in land; it may, indeed, be advisable to dinuming the the manare in the farrows when plat dreuibs of potaeh and lime, or saperphosphate of lim
Muscat Grapes: Muscat. We do not know of wit variety that is more musky than Macest of Ale andria. Taere are Mrs. Pince, black Kineth with a good Mascat flsvour, and Chavielas Man Mascat Dr. Hogg inquired sbont is af fae Frontignan, raieed by Mr, Pearson, Chilwell

Names of Fruits: \(P\). Specimen not sofficiently good to determine.-A. G.F. 1, Bearré Diel; 2, Cellini; 3, Eyg or White Paradise; 4, Mank'a Codlin. - C. W. Strickland. Pear, Nouveau Poilear: Apple not quite aure of, resembles Annie E!izabath.-Geo. Abbey. 1, Beursé Clairgean: 2 Beurıé Diel: 3, Kaight’' Monarch. - A. J. B. 1 and 2. \section*{CORN.}

Averages. - Official atatament of the average pricen of British Corn, imperial mannure ( \(\mathrm{q} \mathbf{r}\).), for the week onding November 30, and for the oorresponding period in the previous jear \(1-1895\) : Whent, 25s.2d.; Barley, 24s. 7 d. ; Oatu, 14s. 3 d . 1804: Wheat, 20s.7d.; Barley, 22s.; Oats, 14s, \(3 d^{\prime}\)

[The term "accumulated temperature" indicates the aggre gate amount, as well as the duration, of degrees of temperature above or below \(42^{\circ}\) Fahr. for the period named: and this combined result is expressed in Daydemrees - a "Day-degree" aignifying \(1^{\circ}\) continued for in inversely proportional number of hours.]

The districts indicated by nuaber in the first column are the following:-

\section*{THE PAST WREK}

The follo wing summary record of the weather throughout the British Ialands for the week ending November 30, is furniohed from the Meteorological Office:-
\({ }^{6}\) The weather was almost continuously dull over England aad the cast of Bootland, with a grost doal of mist; over Ireland and the weat and north of Bcotland the aky was frequantly olear-eapecially during the earlier half of the frequantly oloar-tepecially during the earlie half of the
peried. Vory little rain fell in ony part of the Kingdom peried. Very little mia iell in any part of the Kingdow antil the middle of the wook, but from that time
wure frequeat, adia wowe place rather considerable. of the period, but subeequently roee, and gradually became high for the tive of year. The average values for the week wore conequeatiy again above the normal, the excess ranging from \(1^{\circ}\) in moet of the woatern and north-western districts, to \(3^{\circ}\) in the nortb-eat, cont, and wuth. The higheat of the maxima ware reoodted toward the end of the week, and varied from \(66^{\circ}\) in the "Chanoel Vlands," and \(57^{\circ}\) in "England,
8.W. and Ireland, 8.' to \(49^{2}\) in "Ragland, N.E.' The loweat of the minima occurred either on the "44th or 25 ih, when they ranged from \(23^{\circ}\) to \(30^{\circ}\) in Scotland, from \(23^{\circ}\) to \(87^{\circ}\) in Ireland, and from \(29^{\circ}\) to \(33^{\circ}\) over England. In the 'Channel Islands, the lowest reading was \(37^{\circ}\)

The rainfall exceeded the mean in "England, 8. and the Midluad Connties," and just equalled it in "England, \(\mathrm{E}_{\mathrm{o}}\) ' In all other diatricts there was a deficit: that in 'Scotland, \(N\). and \(W\).' being considerable.
'The bright suoshine whe very deficient over England and the east of Scotland, but exceeded the mean in Ireland and the north and wes; of Scotland. The percentage of the possible daration ranged from 33 in 'Ireland, \(\mathrm{N}_{\text {., }}\), and 30 in ' Ireland, 8.,' and from 21 in 'Scotland, N.,' and 20 in Ecotland, W. and the Chennel Islands. to between 10 and :3 over the reater part of England, and to 1 in "Sootland, E."

\section*{VARIORUM.}

Chaysanthemumb Grafted on Anthemis. -I have lately noticed, at the Cbâtear of M. Jean Everaerta, Mortel, Antwerp, foar Chryanathemams grafted upon Anthemis atock; and the following are the dimensions of thene plants, and the number of the flowers:-
\begin{tabular}{|c|c|c|c|c|c|c|c|}

\hline Etoile de Lyon, 300 & .. & ... & ... & 5 & feet & 81 & fee \\
\hline Précoce blanc, 500 & ... & ... & ... & 时 & " & 91 & " \\
\hline Val d'Andorre, 200 & ... & ... & ... & 5 & - & 6 & , \\
\hline Avalanche, 200 & ... & ... & ... & & " & 8 & " \\
\hline
\end{tabular}

\section*{Ch. De \(B\).}

Evolution in the Chrysanthemum.-Mr. Martin White's suggestion to the gardeners to atudy evolation in the Chryanthemum is one which they ought to find particularly easy and pleasant to follow. Nobody knows with absolate certainty the natural species from which the vat number of forms of the flower at prement known to horticulture have eprung. The Japanese tock on which we have worked was already modified into mapes and hues correspondent with the dainty taste of that people when we began operations upon it. Bat nothing is more certain than that in the Chrysanthemum the gardener poasensen a flower of unequalled mobility, whether he attempts its modification by means of hybridiation, or by the better, if slower, means of selection. Nor is it to be napposed that the scientific interent in the process is exhausted by the fact that countlens varieties of blooms have already been produced. It is a remarkable thing that hitherto variation has followed taste with what might almost be called docility. In Japan taste is prim and neat, or nothing-the Japanese Chryanthemum is prim and neat. The elimination of the unprim has been, of course, a prime element in the process. In this country the taste in for variety, and even extravagance-and the docile Chrysanthemum is mont varied, and as extravagant an conld be wished. Bat in both countries taste, concerned entirely with the bloom, has ignored the calyx, and under the mont fantatic of flowers the observer may till aee the unchanged calyx of the natural flant, hardly differing, save alighty in the morphological regards demanded by the increased weight of the floral atructure, from the calyx of the wild Chryanntheraum common to the Scottioh fielde. Will any gardener, to whom experiment is dear, try his hand at the modification of the calyx? And, by the way, has any gardener ever tried to "improve" the wild British variety referred to? Dundee Advsrtiser, November 21, 1895.

Ampricar Plants: A. J. B. Natarally, you ahould apply to the addres givea in the advertisement, viz.:-Harland P. Koliey, Highland's Nareery, Kewana, Michell County, North Carolina, U.S.A.

Booss: C. W. S. My Gardener will give you jat the kind of information required.-T.G. \(\boldsymbol{H}\). Cultivated Plants, by F. W. Barbidge, publimhed by Blackwood, London; an excellent book, now met with only at second-hand book-shops. J. D. B. My Gardener, bs H. W. Ward, pab. lished by Eyre \& Spottiswoode, Eatt Harding Street, E.C.; Vines and Vins-culture, by A. \(\mathbf{F}\). Barron, pablished at 171, Fieet Soreet, E.C.
Cinrrarias, \&c., with Drops of Water on the Lhafo kDGE: J. A. The reate of exadation from the leaves in the case of plante atanding in recentlywatered soil. There is some amount of abarption of moiature by plants not in a gorged condition, bat not by others.
Correction: Re obitaary notice of Richard Gilbert. -We are requested to state that the late gardener at Barghley House was not the tenant of the garden, at atated in our notice of his life, bat continued to be head gardener to the last.
Croton Leavrs Injured: M. \(R\), Morgan. The damage to the Croton leave may arite from the ill-effect of steam from the hot-water pipes; or If the pipan have been re-blacked, from the atulf uned in colouring the pipes. Some are unwise enough to use pas-tar for this purpose, and the resalts of this may be witnessed for years afterwards. Sometime an untrapped drain in the house will cause aimilar damage. In fact, there are numbers of ways in which the mischief might arise, and which would be eavily determinable if we were on the pot, but not easy for an absentes to point out.
Dresing for Vines: C. S. If you carefully real our "Fraita under Glass" Calendar in Gardemers" Chronicle for November 30, you will find just the mort of information that you require.
Flora of Dumerirsshire: J. \(K\), You should advertise in our columnt or enquire of some Scote bookteller.

Fruits, Serdling: Jno. Barnett. Your aeedling Apple is fairly good, but not superior to many others in caltivation. The Pear neems to be distinct, and well worth cultivation. We cad find no trace of the name "Auguste Mignaud." Your photograph show that an excellent crop has been borne by the tree, and it has been very skilfully cultivated.
Ivy: L. P. We do not suppose that Ivy or any plant is bsnefited by having its leaves cut off, but tidy gardeners cut the Iry that covers their walls close to the wall almont, so that the foliage shall have a neat fresh green appearance, and not, owing to ite weight, pull the entire plant to the ground, an it otherwise might do.

Kew: F.W. If you will enquire of the Director, you will be furnished with full particalars regarding necessary acquirements, \&c.
Mareet Annoals: \(W\). \(\mathcal{f}\). . Theme are far too numerous for as to give a list in this place, but we will mention a few. Dwarf Nastartiams in good distinct colour, Coreopsis vary, Chrysanthomam Barridgeanum, C. carinatum, C. tricolor, Gjeophila panicalata, Reseda odorata (Mignonette). Ten-week and East Lothian Sbocke, Petunias, Verbenas, Zinnias, Asters, Sweet Sultan, various Globe Amaranth, Balsami, \&cc.

Manure for Ligit Dry Land: J. L. A. Whatever manare is applied ahoald be well-decayed and rich, \(\operatorname{coN}\) and pig-dang answering better than that from the stables alone. If you could pen some sheep on the land, way, from forty to sixty animals, on half-ncre patcher at a time, feeding them with oil-cake, and Swodes, or Tarnipm, they would consolidate an well an enrich it. The drainage-water from the dung-yard abould be asped and distributed over the land in the winter. The land should not be ploughed or dag before it is required to be planted, an much of the fertile propertien of the manure is soon lost in very lighs land; it may, indeed, be adviaable to diatribute the manure in the farrows when planting the tubars. The crop would be improved by dreasing of potash and lime, or superphosphate of lime.
Muscat Grapes: Muscat. We do not know of any variety that is more masky than Mascat of Alex andria. Taere are Mra. Pince, a black Grape, with a good Muscat flavour, and Chasielas Musqué Muacat Dr, Hogg inquired abont is a fine white Frontiguan, raiged by Mr, Pearson, Chilwell.

\section*{HEATIMG APPARATUS DEPARTMENT.}

\section*{Hyglenic Heater}

Burning Paraffin or Gas without smoke or smell. Taese Heaters are constructed as a means of Heating by Hot Air without the use of hot-water or fires. Its peculiar conatruction economises the heat generated, 80 that there is \(n 0\) waste of heat or fuel. There nothing whet combustion in this stove, and actually everythioy conducive to their health it should be obserred that plants may be had in full bloom throughout the severest winter. This cannot he obtained in stoves of other system. See list for full description

\section*{'Invincible" Hot Water Apparatus.}

MOST EFFICIENT, AND Cheapest IM ExistENCE. Requires nosunkstokehole and no brick setting. Will last all night without attention. Burns house cinders: nothing for fuel next to one can fir it. A child can stoke it. Success guaranteed. No. 1 Boilers only, capable of heating 75 it.

\section*{W. COOPER, Ltd., NINTH ANNUAL CLEARANCE SALE-continued.}

The Rapld Propagator.
Taz onty Pizyet Propagator for Raing Playts from Seeds, Slips, or Cuttirge.

This Propagator is the best and cheapest now bofore the pablic, and will be found especially eerviseable to Amateurs and Gardeners who require to strike cutting and raise seed in a short space of time.
One of the Propagators will raise large quantities of plants in the apriog. thus-to a great extent-dispenoing with the neceasity of striking cuttiogt in the autumn; it being well tmonphere so prevalent in this country. This method of propagstion eaves the trouble and annoyance resulting from the loes of so many plants in the winter time, and also makes it unnecsasary to occupy so much space in storing a large number of catting.
These Propagators are composed of an outaide casing, with rutrable sheets of alass on top. The bed or bottom is formed of a tank. in which a constant circulation of Hot Water is lept ap by the Heater (see illustration), the pots being phaged in a bed of cocoanut-fibre refuse, which should be kept moist. It is heated by oil, one pint of which will burn at least 30 hoars. Securely packed (no charge for packing) aot put on rails complete at the following sizes and prices:-

T
HE MOST IMPORTANT LESSON Ewulapius tried to impress upon his puplls was, that the chief trouble afficting humanity Wan due to impurities of the
blood. All disorders may be triood to this fact, for unless the Blood. All disorders may bo triood to thin fact, for unless the
cource of life is free from disease-germs, it canot have that atrength which is necessary for good health. HOLLO AX PILLS are composed of the moost precious herbs and soothing balamia which Mother karth can orrer to her children, thereis craved by the aystem. It is no vain boant to asay that this it the most wonderful discovery made in the annals of medical ccience; they will cure or relieve all dieaases.

A SIXPENNX BOTTLE will MAEE a GALLON of DELICIOUS WINE.
Sample Bottle post-free for 9 Stamps.
A Lady writes: "The 6d. bottld of Ginger Wine Essence made several botties of moat delicious wine, far better than what we have paid 2s, a bottle for. It is most suitable for chintren's parties.
NEWBALL \& MASON, NOTTINGHAM.
MASON's EXTRACT OF EERBS, for making delicious Nan-intoxicating Beer. A 6d, bottle makes 8 gallons. Sample bottle, 9 stamps ; or a sample of both, post-free, for 15 stamps. AGENTE WANTED.

Five 1st Prize Medals recently

\section*{WALLFLOWER RUBY GEM.}

This grand Novelty is certainly the most brilliant and effective variety of single Wallflower hitherto sent out.

The colour is a beautiful clear shade of Ruby-Violet, with a bluish satin-like sheen (quite unike the old rurple Wallflower, whirh is more dark and dull in colour) and when seen in a mawer of meciumpheight, and thy fowers. are extra large and of qood fubstonce. A coloured illustration of this Novelty will be issued with our General Seed Catalogae for 1896. Large Packets, retall, 1s.; smaller Packets, retail, 8d.

\section*{GRAND NEW CRIMson}

PERPETUAL - FLOWERING CARNATION, URIAH PIKE. (Grown by Mr. GEORGE MAY. Teddingtor, from whom we have bought the entire steck duard of seed grown thie year, and now cifer the same for the first time.
Awarded Six First-class Certificates, besides the Siver-Gilt and Silver Menals of the R.A.S. the most decided acquisition to the Tree or Pervetual-flowering class that has ever been raised In point of colonr this noble Canation reigns eupreme, being a veritable GLownve CRIMsonIn point of colour this noble Carnation reigns supreme,
Fackete of 50 Eeeds, retail, 2 s .6 d . eaeh; Packete of 25 Seeds, retail, 15.6 d . each.

SWEET PEA CUPID.
We call apecial attention to the new dwart SWEET PEA CUPID, a most unique Novelty of American origin, for which we have been appointed by the Vendore, MFSSRS. ATLEE, BURPEE. AND CO., PHILADELPHI A, sole Agents for the distribution to the Trade in Great Britain, the Anstralian Colonies and India

A brief Description of Cupid (the only dwarf Sweet Pea ever known). - The foliage is "Emily Hend ; bussoms pure wary-white, of unequalled substance, and fully as large as 15 inches in diameter. The stems are about 4 inches long, bearing two or three blossoms, all very near the end of the stem. It is a wonderfully free bloomer, and begins to flower as early as May and continues until November. The seed is white, and of usual size.
Packets of 20 Seeds, retail, 18. each; Half-size Packets of 10 Seeds, retail, 8d. each Electros, for use in Catalogue, sapplied free on application.
important novelty of last year.
PRIMULA FIMBRIATA RUBRA SUPERBISSIMA.
This grand dew Primula may be described as the red counterpart of P. alba magnifica,
The fringing of the extra large bold flowers-which are of great substance-is of the same heavy character as in P. alba magnifica, and which distinguishes that variety from all others; whilst the colour is that of the best type of the ordiany rubra.

Per Packet, retail, 2s. 6d. ; Larger size Packets, retail, 38. 6d.

\section*{ITALIAN CANNAS.}

THE group of Cannas called in France of medium height, with numerous large flowers, and in oolouring as brilliant as varied. We have witnessed the introductions of these fine plants since 1859 , when M. Année first obtained crosses at Passy. Before that time Cannas were hardly known for summer bedding, except in botanic gardens. At the Muséum, there was planted every year a series of the following speoies:-Cannas discolor, edulis, glauca, indioa, gigantea, flaccida, and Warscewiczii. Then oame the sorts which Bouche desoribed in the Berlin Botanic Garden; those whioh Roscoe had figured in his Scitamineous Plants, and certain others which Loddiges had depioted in the Botanical Cabinet, and whioh were hardly seen save in some English amstear oollections.
To M. Annee, then, may be attributed the first important results in the artificial fertilisation of Cannas. The flowers which he obtained were varied, bat the plants were often too large. Soon the principal object of the growers, among whom were M. Lierval, M. Bihorel and other nurserymen, was to develop plants with large bighlycoloured foliage. Seedlings raised by M. Crozy, of Lyons, some time after, proved quite a revelation. He produced a race of Cannas with large and fine flowers; among these the variety Madame Crozy was for some time the most beantifal known. Subsequently other raisers, foremost among whom were MM. Vilmorin at Anibes, obtained some very handsome varieties.
But the olass of which we wish now to speak, and which we may call Italian Cannas, are a great adranoe upon any others yet obtained. It is to MM. Dammann et Cie, nurserymen, of San Giovanni a Teduccio, near Naples, that we owe these splendid plants. One of the partners in this firm, M. Sprenger, said that by always working on the same lines, and always interbreeding the large-flowered varieties, nothing would be obtained more remarkable than the varieties already in existence. He, therefore, sought to infuse new blood into these hybrids, and this was introduced by employing Canna flaccida. This species, originating in the sonthern United States, is of medium height, 3 to \(4 \frac{4}{2}\) feet, and bears large fiowers, one petal in which is especially developed.
The firut triale made by M , Sprenger were unsuccessfal. Bat in \(1892-93\) he obtained by fertilining Canna Madame Crozy with the pollen of a fine variety of C. flaceida, a aplendid plant, which he named Italia (fig. I14). Apart from the unasaal nize of the flowera and their beattiful golden-vermilion colour, the plant has this pecaliarity, that the general
form of it in flattened，resembling an expanded Cattleya［Or a Japanese Iriv．Ed．］
The similarity to Cattleya is increased by one of the petals being horn－shaped，like a lip．Here is the description of Canna Italis（see fig．114），taken from living specimens：－

Plant vigorous，tufted，robust，very floriferous，height from 150 to 2 weitres（ 4 委 to 64 feet），to the anmmit of the apikes，ateme dark green，atrong，erect，leaves uni－ form dark blnish－green，erect or a litt！e spreading，in texture very firm and vellum－like，the petiole deeply channelled，amplexicaul prolonged into a very atout and rounded midrib，blade oval，pointed at the sum－ mit，decarrent at the base，in length 0 m .60 by 025 m ． （ 2 feet），in width 10 inches；deeply channelled in the middle，veins acutangular，alighty raised and paler in colour，truseen 1 m ．（ 33 feet）in height，often rather ansular，triquetrons at the top， standing erect in the middle of maller floral leaves and very long convolute shenth ；opike erect，a foot or more high，floral favcicles distant，sensile， bifloroas，having at the base one common bract，very brosd，short，obtuse，membranous violet－brown；the two bracte of each flower longer， 0 m .015 （ball an iach），oval，epoon－shaped，obtuse，erect，violet． Opary oblong，wrinkled，green and violet，with three rounded corners sarmounted by a calyz with three erect concave sepalr，separated as far au the bane， equitant，oblong－oval，obtuse，in colouring red－brown， rather plum－coloured，in length 0 m .020 （three－ quarters of an inch），and \(0 \mathrm{n}, 010\)（three－eighth of an inch）in width．Perianth very large，erect， very widely expanded，two of the outer division lanceolate，pointed，spoon－shaped，in length 0 m .06 m ， to 0 m .08 （a fifth of an inch），in breadth 0 m .20 to \(0 \mathrm{~m}, 025\)（three－tenths of an inch）， in colour dull yellowieh－red，atreaked with much dather brownish－red linea．The third division narrower， 0 m .014 to 0 m .015 （half an inch to five－ ninthe of an incb），more pointed，and yellower at the tip；interior lobe nearly equal，obovate，obtane， ontire， 10 to 14 cent．（ 3 录 to 5 多 inches）long；in width 0 m .045 to \(0 \mathrm{~m}, 060\)（three－twentiethe of an inch to a quarter of an inch）；two are folded one over the other，and opposed to the third．The nurface of all three is flat，and the upper part widely expanded，so that it somewhat resembles a Cattleya flower．＊The ground colour is a beautiful orange－red，heightened with vermilion over three－fourths of the surface，and prolonged into oval atreaky and apots on a wide golden－yellow margin．The fourth lobe is elliptic，of the same width，twisted，the edgen approximate an in the lip of a Cattleya，deeply bilobed at the top， waved，sometime somewhat laciniste，of a beautiful orange－vermilion colour，bordered with gold，with a large central and bailary channel，ahaded with parple on a dark ground；ataminiferoul lobe，a little nmaller，hatchet－shaped，dark vermilion，the edge gilded and atreaked with red，stamen linear， arched，inserted laterally towards the middle of the right side，yellow at the bave， 0 m .0 .15 （half an inch）long，piatillary lobe narrow，flattened，at the unmmit obliquely flattened into a scimitar－like form， the colour golden－yellow and dark vermilion－red．

It was in the aummer of 1893 that among a thounand seedlings，this variety，Italin，flowered with snother bearing yellow flower shaded with purple， and named Auntria．Thil latter variety may be likened to a large Talip or jellow Lily placed on the top of truses which emerge from beautiful green foliage．M．Sprenger continued to raise seedlinge， and the rearation will not be long in appearing．For example，in the eummer of 1894 ，he nucceeded in llowaring some splendid varieties，among which we note the following：－

Atalanta．－Lenves green，bordered with red，very lange clear vearlet fowers，or blood－coloured with fame－red centres．

Aneriou，－Leave dull red，atreaked with greenish bronze，quite ditinet，very brilliant，very large cap－ minw－red flowern，partly streaked चith pale yellow． A eplendid plapt．

\footnotetext{
＊For thid macou in Italy the nacme of Orehid－fiowered
}

Burgundia．－Leaven glaucous，mall，with brown margins，large golden－yellow flowers，interior petala scarlet，the other red，spotted．
Allemaniana．－Leaves very large，like those of a Musa．Flowers，the largent of the clans，carmine－ red，with a wide golden－yellow border，potted with scarlet beneath．
Twelve other varietien raised from seed in 1894 to 1895 gave still other new varietien and colours not hitherto seen．They are not yet named．We are glad to give our reader these dercriptions thus early， with illustration taken from photograph of a plant of Canna Italia which I flowered thin year at Lacroix，and which are exact as to appearance and dimentions．Ed．Andrb．［We are indebted to the pablisher of the Revus Horticole for the use of the woodcuts illustrating this article by the accomplished Editor of that journal．］
of December 22．The havoc it wrought about Brad－ ford will cause it to be remembered a long time． Mr．Charles Harding，in a paper describing the phe－ nomenon，said the storm was one of exceptional severity，especially over the northern portion of Eagland and Ireland，and in the south of Scotland． The greateat violence of the wind occurred at Fleet－ wood at about 9 A．m．，and for four hourn the velocity exceeded that of any wind recorded in the Britith Iales．The Board of Trade Returns show that 167 lives were lost daring the gale，and the destruc－ tion of property was enormous．Within a day or two of the close of the year 1894，temperature for the preceding three month had been much above average，and farmert profited by the mildneas，for the after－grass was plentiful，and the cattle could be turned ont almost every day．But after that，right away into March，more than two months，the tem－

Fig．114．－canga italia：to show habit． （One－twentieth of the natural size．）

\section*{A SUMMARY OF THE WEATHER OF THE NATURAL YEAR．}

Trim following obvervatione were commenced at the autumnal equinox in 1894，and brought to an end with the similar event in 1895，the locality being Bradford．The woather during the latter part of September and all October in 1894 was unre－ markable．The treen shed their leavea naturally through decay，and not from violence of the weather． The first frost occurred October 22．On November 12 the barometer wa：very low，but as the weather at Bradford scarcely corresponded to so low a reading， one natarally looked for the cause nomewhat farther away．In South Waleu and the mouth－weat of Bagland the rain fell in torrente，canving the rivers rapidly to rise，and flood the adjacent country． Much damage to property and eome lons of life way the consequence．For aome days after，storms and uhipwreck farnithed the newnpapers with senational matter．The next event was the great wind－atorm
perature was much below average．Perhaps the weather of January，1895，would only be rightly described in anying it wae about the wornt and most trying to man and beat that ever wae．There were heavy falln of now，which were drifted and piled up in all sort of objectionable places，making it necen－ uary for much labour with the ahovel，in order that passengers could get about at all．Daring the day－ time it frequently thawed and rained，and no the roade became aluahy and wet．Frost an frequeatly fol－ lowed at night，when the roads became as alippery as glase，and very dangerous to travel．With all this， and the intense cold，besides hardly any anathine， and much mist，it will be seen what hae been waid about January can scarcely be regarded as too bad． The firat two weeke of February were even colder， and ss the severity of the weather had been pro－ loaged，the affering amongat the people became acate．On Febraary 8，temperature fell to about zero all round Bradford．From the middle of Febranry there wat a condition of thing nomewhat
more bearable, but to the second week of March Natare was bound hard and fast with frost. Oa Wednesday night, March 13, there was a fine display of streamers. The phenomenon was een at the ume time by different persons in localities right across the country, from Scarborough to the Isle of Man. Afterward the temperature was decidedly warmer, but it would be difficult to prove that one circumstance had anything to do with the other.
Sanday, March 17, way the first epring day. Oa Sanday, March 24, it was very rough, rain and wind reeping everyone within doorm, In the midlande,
winter to aummer. The remainder of May and all Juae whe generally suitable for vegetation; notwithatandiag, scarcely any bloom was borne by the Thorn, Byech, Sjeamore, Ok , or other forest trees Oa Jane 14, the hay-harveat commeaced. The crop was light, bat of good quality. The fore part of July was marked with frequent thander-atorms, the lightning at times being particalarly vivid, and almost continuous. The latter part of Jaly, all Aagust, and the bagianing of September might be deacribed as growing weather, for generally it was warm and humid, with rather frequent thunder-

Fig. 115.-canna italia: single flower, natural size. (see p. 704.)
the wind wan mach atronger than about here, and caused there great damage and low of life. On Tharday night, April 4, between 8.30 and 10, there war a halo around the moon; at the same time it Wa observed by a gentleman who was travelling between Liverpool and Southport. Henc 3 , the caue of halon must be at a great altitude, or it could not have been aeen at Bradford and Southport at the ame time. The lat week of April and the firat two Week of May, the weather anited vegetation exactly. It wat commonly taid that it had been made on parpone for the farmers, and certainly ite effect was mouddon as to appear magical. The trees in the short time nam ad turned in their aapect from that of
atorms and rain. The remainder of September wan exerptionally bright, hot, and dry, witing the ripening and harveating of all kinds of vegetation.
The floods of November, the winde of December and March, the inclemency of January, and the low temporature of February, are the extraordinary circamatances of the weather of the natural jear. Excepting them, there has been a near approach to a meteorological arerage duriag the time under consideration.
The foliage of forest trees has not suffered this year from any ill effect which mometimen arise from wind, front, hail, or insecta. Of the thirty-fire forest treen, whone girth I regularly measare,
eighteen of them have increased more than they did in 1894, eight of them lena, whilat nine of them have grown alike in both years. The increase of all the thirty-five treen this year is 354 fractione of an inch; lat year it was 326 (the fractions are sixteenthe).
The Apple crop hat been exceptionally good. The cereal cropa are eatimated to be under average in quantity, but in quality they compare farourably with those of other years. John Clayton, Bradford, November, 1895

\section*{Orohid Notes and Gleanimg8.}

\section*{A CURIOUS CATTLEYA.}

Messas. Sander aend un one of the mont remarkable semi-double Cattleyas we have yet met with. The part of the flower are fifteen in number, vie., three espala, three outer petals, three inner petala, a column of three atamena, and an ovary with three compartments. The arrangement of the part is even more carione, tha outermont row of three sepala is normal in position and form, the sacceeding row of three petals is not alternste with the sepels, but moperponed to them (radial chorisis). These three petals hava the form of the ordinary lateral petals. The inner row of petale likewise is superposed to the preceding row; one of them, the posterior one, is concreacent with the column, and has the form of an ordinary lateral petal, the other two anterior or antero-latersl are lip-like. Within thim inner row of petals is the column bearing one median or posterior anther, and two lateral oner. Of the three compartmente of the ovary, two are poaterior, one anterior. The arrangement may be underatood from the annexed diagram, where \(x\) ie the sxis of the plant, \(S\) the sepals, \(P\) P the two rows of petale, A the outermost anther, \(a\) a the two anther of the inner row, whilat the central triangle sepresent the ovary with its median carpel in front, 0 , posite the aingle anther A, instead of in a line with it as in Orchide generally:-

\section*{Orchidy at Oswald House, Edinburgh,}

In the Orchid-houser of J. Bachanan, E:q., the number of plants in flower at this neason is small, but everal interesting pecies were noted on the cccasion of a recent visit. In one house were noted fine plants of Cymbidium giganteum and Cymbidium Lowianam shrowing up atrong flower-apiken; and a plant of C. ainense, a much leas-conspicuous plant, with purple and brown coloured flowers, which are fragrant. There were also the odorons Dendrobium heterocarpam, or more properly called D. aureum; and the now popular D. Phalmaopric, in aeveral shade of colour, and of variou sizas, and these jadging by the number of plant observed, are the owner' favourites. Large baskets of Coe'oajne Massangeana were in laxariant health, with mome fow flower-apikes on plants in the cooler houses. C. barbata, with its coriaceous bold foliage and areet spiken of flowera, promite a good dirplay. Pianta of this Ansm apecies were doing well in the inter-mediate-hoase. The gem of this geno in flower wat C. Gardnerisuam, a native of the Khania Hills, discovered in 1837, but atill anything bat common. The peado-balbe are club-thaped, with broadish leaves, and the racemen of flowera of almont tranapareat whiteness, with just a slightly lemon-coloured blotch on the lip, have an attractive appearance. Tubfuls of C. cristats, a yard in diameter, were nearing the flowering atage, and the varieties alba and - her will moon give an abandant crop of bloom. Lelia ancepw, and ite varieties Guuldiana, Scottians, and others were numerounly reprenented. A fine plakit
of Lycaste Stinneri alba throwing up ite flowern appeared in eplendid condition. Masdevallia tovarenais and M. bella were vary bright. The latter plant is said by Mr. Wood, the gardener, to be almort perpetaally in flower. A verylarge apecimen of Odontoglossum coronariam, sometimen called O . brevifolium, was freely covering a large raft nearly 3 feet long by 2 feet wide. This plant hav not flowered in these garden as yet, but efforts are being made to induce it to do so. Many other apecies of Olontoglossum were showing their flower-mpikes; a good plant of O. Edwardi, carsying an onormous branched spike; aeveral Oacidiame, Cypripediams, and othera were in bloom, and the honse presented an interesting appearance. \(H\).

BANANAS AT HAMPTON.
There ara few nobler leaf plant of a tropical nature grown ander glase here, and sometimes with fine effect out-djors in warm positions, than are Musan. \(U_{i}^{i}\) all vegetation, these plants give some of the most luxuriant and the mont rapid growth. Pianted as sorted sackers of small dimensions in a heater house, in a few months they have tecome grand epeciment, having masive trank and magnificant foliage, and thus are most speedily noble decorative objects of vegetable production. It is not usually the case that product of this description are found in gardens of limited natare, and where the glass area is comparatively restricted. There are alway fonnd, however, exceptions to every rule, and there in a mont admirable illuatration of this fact to be now seen in a house attached to the residence of H. O. O'Hagan, Esq., Hampton Coart, Middlesex. That there is here a good deal of glans relative to the dimentions of the place, there is no doubt; but much of it is devoted to Peaches, Apricote, Vinet, \&c. The garden lie close to the Thames, and rather too much so to be pleanant, when the river is exceptionally high. Lat winter when the great Thames floods prevailed, the higher portion of the ground were immersed 3 feet, and the lower parta from 6 feet to 8 feet in water, which poured through the gardens and rouad the houses in the most farious fashion; of course in such cane, everything had to bo left to ite fate, and a rough fate it was to many. Ose of the oddest shinge in the Pesch-honee was that all main stems under water suffered nothing, but all the lateral and young hhoote were killed, whilat above the water-line noae suffered. Whether becanse thas aaturated or beciuse of the exclusion of air, the immersed young wood died, in a point which may be left for plant-phyaiologiate to decide. It will not be a matter for aurprise, as was mentioned shortly after in these pages, to learn that this flood having risen to a height of 4 feet in the house devoted to Bananas at that time, grad plante, and carrying huge cluctera of frait, were killed almont outright. So complete was the work of destraction, that out of ten fise specimen not a single sucker cunld be found alive a week or two after the fluod had abated. The gardener, M- Lat, however, did detach eome dormant knobs or aucker bates from the bottom of the atem: after they were taken from the soil, and these being placed in pote singly and atood in warmth, presently pushed growth, so that in March, when the house was again prepared for the plants, those about 18 inches in heightwere pat out in the beds, and another good atart made. The result may be aeen to-dsy by anyone interested in Banaia culture for fruit prodaction, who may care to look in at River Houv. Tbe house devoted to thene plants is an erect apsu, 21 feet by 16 feet, and is some 11 feet in height. There is a broad centre walk, and on either side a bed enclosed in 9 -inch walla, the inner width being 4 feet. These beds are 2 feet in depth. The heatiag force in obtained from a double row of pipes that ran round batween the inner walls of the beds and the outer wall of the house, and also from other pipes sunk beneath the iron grating which floor the main walk of the house. Ai the bottom of each bed
there is some 9 inches of rubble for drainage, this materially reducing the woil area. On that are laid firat rough pieces of turf, and then the compost. Thia is a material of very innocent nature, being chiefly old pot-soil from Chryannthemume, \&c., with which is mized a moderate quantity of old hot-bed manure, and rather more of turf edginge or trimmingn. \(O\) it the atereotyped turfy loam in ite virgin atate there is none. Nearly filled to the level of the walle, this comporetetle down materially during the seavon, so that now ite level is some 3 or 4 inches below the wall tops. Four plants only are growing on either side this year; even of themare carrying hage claters of fruit, the other being planted later, will not frait jast yet. Thene clastern are from the tips of the first whorl of pode to the point of their floreacence, fully 5 feet long, but the actual length of the frait claster is 3 feet. The fruits will commence to ripen in Fobraary, and those now set will occapy some two month before they are all ripe. The present average temperature is \(60^{\circ}\), but in the summer it is, of course, much higher. There are no mulchings, and no atrong ammoniacal mells that are so offensive in close plant and frait-hoases. No artificial manure of any tort in employed; the only description of feeding otherwise than the ail and plenty of water furnith is found in occasional waterings with the contents of a cesspool. The plants now run to about 10 feet to the top of the leafage, which is of very noble character, and reaches 6 feet in length, and of proportional width. The stem of the plants close to the ground are generally 3 feet in circumference. The variety is Mana Cavendishii. Could Mr. Last but exhibit one or two clasters of these grand fruits, when matared, at the Drill Hall, no doubt he would receive a high award. It seems a pity that because auch cannot well bs the case, that some honour may not be paid to auch aplendid culture as this case show. No one can ase what is here produced, and the surronndinge, without realiting that Banana caltare is at H mopton of the most meritorions natare. A. D.

\section*{ABOUT CHRYSANTHEMUMS.}

\section*{(Continued from p. 85z.)}

Chrysanthemums at Hollyhurst, Darlingtun. -The collection of Carysanthemame as Hollyharst, the reaidence of W. Harding, Esq, though not large, is extremely well grown, and relect credit on \(\mathrm{M}_{\text {r }}\). Cualtas, the enthquiastic cultivator of the flower in the district. There are to ne 400 plante grown, the \(J\) apanese forming tha balk of the number, and nearly every one carried good exhibition bloome. Thare were grand blooms of Lord Brooke, C. Davis, E Molyneux, Mdlle. T. Rey, Loaise, J. Sarimpton, and others tos numerous to mention. Among the iccarved, there were good blooms of R :falgens, Golden Empress, Jeanne d'Arc, Violet Tomlin, \&c. Bash plants are alao well groon here, and in the greenhouse there were some grand specimens of Salvia aplenden:-a mant of colour. The gardens generklly werd a pictare of neatnem and order, nud, connidering the number of men employed, show that the old achool of gardeners can give nome of the younger onen pointf. W. 8.

\section*{Show Cerysanthemums.}

I would akk, cannot the National Cbrysanthemam Society make a limit as to the height of fower shown of Japanese varietien, at their 0 on and affiliated socisty's shown? Taere is nothing which mars the look of the tables more, than to see one show-board of cut blooms propped up (at if they were on atack pipes) about 18 inches high, and on the next board the bloom may be abouts 6 inches higb. I cannot underatand the use of having showbourds 3 inches high in the front, and 6 inches at the back, if such cups and tuben are allowed to be placed apon them. If the flowers were staged of an uniform height, the tablen would have a more astisfactory appearance than that which prevails at present. There is generally a fixad limit at provincial ahowa an regarda the Pompona, and it in
unually that they are nos to exceed 6 to 9 inches ; why, therefore, no rale to the aame effect as regards Japanese blooms? There is another proposal I should like to ventare to make, that is, the syatem of offering prizes by proviacial shows. I do not see why they hould not offor them the anme as the Nitional Rose Society, viz., to growera of 50 to 100 plants, 100 to 300 , and from 300 to 500 . M. E. Mills, The Gardens, Coombe House, Croydon.

\section*{Foreign Correspondenge.}

\section*{A TROPICAL FROG.}

Unoer the heading of a tropical frog at Kow (Gardeners' Chronicle, November 30, 1895) I read with much interest a note on that sort of irog. I had these creatures myself for many years in one of the houes ander my management at Herbault-en-Bauce, France, having received them from Gaadaloupe, where they are aid to be very abuadant; but however atrange it may seem, I could never acclimatise them in any of the hot-houses, for as often as they were taken into other hoaser, thep lived only a few menths.

The house in which I had kept them for tea years was a large lean-to, the back wall of which was nearly covered with blocks of hard wood, covered with the bark, plit in large pieces, and nailed to the wall. O \(\downarrow\) these blocks a fine vegetation of Ferrs, Bromeliads, and Aroide, grew, and it was among those plant that the froge used to harbour, and enpecially down in the hearts of tall-growing Bilber-gias-in fact, I never aw them spawa anywhere else but just in the centre where the water lodges, and the frogs remained hidden in these plant during all day; but in the evening and at night they used to run nearly all over the house, and were very difficult to catcb. I tried many tim to catch thein, at the ame time carrying a light in one hand, bat it was almost imposible to do 10 , they moved so wiftly; but I learnt to catch them in the daytime by tickling them down in the heart of Blbergias, when they would jump on to the walke of the houses, and thus render it possible for one to catch them. This apecies of frog is more difficult to acclimatise than anyone would believe, as the following will show. When I leit the gentleman's place abovementioned, the whole of the plants were aold to my new master, and of course with the plants I took cire to take away a good many of the frogs, which I distributed as soon as the plante arrived in different houses, where I thought they would succeed; but they did not livalong, and after oas jear I think there was not one left. I have no opportunity of obtaining any more of them from Gaadaloupe, and it was only when reading the acconot of the froga at \(K 9 w\) in the Gardeners' Chronicle that I remembered having had the sam* kiud. Ch Maron, Orchit Cultivıtor at La Cavuliè e, St. Barnabe, Marseilles, France.

\section*{PRICES OF GARDEN MANURES.}

In these daye when gardenera for their own as well for their employern' ake, are ob'iged to keep their expenzes within reamonable boands, I think it is time to say something about the price of those artificial manures which are now so commonly used, bat the use of which is retricted by the unreasonable prices demanded by soms vendors-especially by those who distribate their manares through middlemen connected with the trade. "Live and let live" appears to be a maxim noknown to some. For example, there is now quite a number of different vendora of Vine and plant manurep, all of or about the ame quality and actual value, according to analysia and the teatimony of gardeners of repate, but which vary in price to the extent of from 30 to 50 per cent. or thereabouts-tbis amount I am credibly informed being divided between the manufacturer and the middleman. A thoroughly well-known agricultariat not long aince asaerted in a northera agricultaral contemporary that if gar-
deners knew as much about manarea an the "sverage farmer"--not a high eatimate of "Horty" -he would not think of buying Vine and plant manares at the prices charged for them, because they were not worth "anything like" the price charged, if they were made of the beat constituenta of manares, compound them an you may. I have long ured "artificiale," and have now price-lists before me of the above manares, both good, and apparently of identical constituents, and the diffrence in the price amounts to the percentage given above. Tie chief explanation appears to bs this, that one
was jut double the weight of that on ground which had received no manare-no other kind of manure being given, the ground being poor. The curiout feature of this trial was, that the increase was prodaced not by the Potatos being bigger, but by there being more of them, and the difforence in the appearance of the crops was marked from the beginning. I state this case incidentally, as what I wish to now is that this manare, made of fairly expensive conatituents, and bought in the way atated, coat just about f9 per ton, and could, ? fiad, have been got for a atill smaller sum. Had I purchased the manure

Fig 116.-a town garden
vendor selis direct to the coasamer, and the oither through the middleman and not only that, but the firnt of these two vendors offere his thanares mixed of his owncomposition, or mixed to the parchaser's own recipe; or he will sell any of the conetituents zeparately, for the purchaser to mix thism at home-a practice now often adopted. I bought this year my Potato-msnure in its separate constituents, according to the recipe pablished by the Technical Elucation Committee of the Wiltahire County Conncil. It c manisted of 4 cmt . each of aperphosphate, kainit, and nitrate, to be applied When mixed at the rate of 12 cxt . per acre; and wider perfectly equal conditions, carefully attended to, the crop of "Bruce" Putato under the manure
from a middleman, it would probably have cols abous \(£ 15\) per ton, 25 to 30 per cent. going, I believe, to the latter, and the rest for advertiaing and profits, \&c. The mont amaring thing about these expenaive manure is that, according to the vendors, one great featare of their value consiats in their lating effects, the best commentary on this quality being that they are to be applied once, or even twice a year, at a rate which would cost about from £25 to £35 per rood. It may be guened, therefore, what proportion of the lanting elements enter in to their composition, and these are, at a rale, the higheat priced, and have hitherto been cupposed to latt a Vine border at a lens rate of application from beginning to ond, Head.

\section*{A TOWN GARDEN.}

The garden, a view of which we give at fig. 116 . is situated in one of the blacket auburbs of London, within a ahort distanca of amoky Stratford, and of factory chimney not readily compatable. The garden was reconatructed about 1855 by the late Mr. Frank Matert, of Canterbury, whose dispoaitions were pleasing to the eye, and specially denigned to hide out adjacent abarban gardens. The illuatration tella its own tale. It mat anfice here to ay that the tree on the leit is a fiae apecimen of Ailanthas glandulosa, one of the beat of town trees; the one near the centre of the cut in an old Almond, whote dying agonie: have been recently cut short by amputation. The large ahrabs are fine old Hollies, which suffered greatly from recent severe winters and the drought of last summer, but which might atill be brought into condition by patience and good management. The tree at the end is a Yarple Beech, and near it are planted Golden Poplar, Acer Negundo variegatum, Parpls Sjcamore, Wistaria, and Laburnume, the fffect of which in pring is very atisfactory. The garden hat for the lat few years been in a measure atilised as an \&xperimental garden for the parpose of ascertaining what ahrubs would sarvive under sach untoward conditions. Ssecimens of these have from time to time been exhibited before the Ruyal Horticaltaral Society, and made the aubject of comment \(\mathrm{b}_{3}\) the writer of these noter, and have excited much ioterest. Aucubas, Hollies, Stimmia japonics, the common Fig, and Metake Bimboo, haveurvived many others, and are still flouriahing. Conifera except Pınue excelea, and Ginkgo biloba, the Maidenhair tree-fine o.d epecimen of which exist in the vicinits-refue to grow. Rota are qually refractory, bat a large nu nber of ceciducua trets and ehmbs do well, and till lately there was a good collection of bardy wild planta and tardy Ferne. Under glam, Vines had c-ared to bear, but Camellias and Fuchaias bloomed freely. Lapageria and S slanum jasminoide were the beat creepert, and at one time there was a mall but choce collection of aucculents. The rec nt death of the owner of the premisen, who took great interent in her garden, and was a geauine plaat-lover, will necenitate the break \(u_{p}\) of the establishment.

\section*{Trees and Shrubs.}

\section*{LORBERG'S MAPLE.}

One of the mat brilliantly-colourt d of Maplet in the autumn is the Map'e no named in gardent. It is a form of the pa!mate variety of the common Norway Maple, and has very deeply-divided palmato leaves, the five to reven lober wedge-bhaped at the bsep, and themselve dividing raher leas than halfway down into oblong lobalet, terminating in long slender point (scaminate). The pecimen before us was sent with a note of commendation by Mr. W. E. Gambieton.

\section*{A Woneqaful Portegal Ladrela}

I eaclose jou particulars and a sketch of a gigantic Portugel Larel growing apon the lawn at Sibertewold Vicarage, Duver, kindly sent me by the Rev. Tho. Falkner, who states, that owing to the severity of the winter last neason, every leaf dropped off, but now it is as green as ever, and well clothed with foliage. Toe tree overahadows a circumference of fally 100 feet; girth of trunk 5 feet from groand, 5 feet 3 inches; height of tree, 26 feet; circumference of head, 100 feet. Alfred Outram, F.RH.S.

\section*{Pinde Devoniana.}

Uader thit name, Lindley (Bot. Reg., 183y) dencribed a Mexican Pine ditcovered by Hartweg in the neighbouthood of Osxaca at a height of 8,000 feet. It is one of the five-lesved Pines with deep green leaves, 8 to 10 inches long, with theath 1 inch long. In Veitch' Manual, p. 184, it is mentioned at clonely rembling P. Montezuwx. of which it is considered at probably only a variety. This, indeed, seems to be the general opinion among
botanists, and a apecimen kindly forwarded from Fota by Mr. Obborne as P. Davoniana, is clearly not distiaguiahable from Montezamæ. Mr. Osborne dencribes the tree an very beautifal, but with a tendency to spread instead of keeping a straight wrunk.

\section*{The Bulb Garden.}

\section*{TIGER LILIES}

Doring the early autumn monthe the varietien of the Tiger Lily, L. tigrinum, afford a rich and distinctive array of colour just at a time when the Sanflower abounds in almost every garden. It is at sach a time that the value of some exceptional bit of colour, such as found in all the Lilies of this section, And apecial favour. And during the present year the Kew Garden authorities diuplayed these to great advantage in a aeriea of beds, ahowy at a considerable diatance. The example tha net will be sure to be frequently imitated in the near fature, Thone among your reader: who may so denire to fill some beds of these kinds, cannot do better than see to their planting without any further delay. The type, as indeed the several varietien of the groap, are all of eany caltare, and will not require any very elaborate preparation in the matter of noil. What thene prefer is, a mandy well-drained loam of fairly good depth. Where very heavy and retentive soils are the rule, the beat way will be to remore the original soil at least 6 or 9 inches in depth, and retarn old potting soil, peat-screening, half-decased leaves, wood-ashea, and road-aweepings, in itm place. And If the garden generally be low or wet, keep the aurface of the beda a little above the uanal level.

When the soil is ready, the bulbs may be planted at about 5 inches or 6 inches deep; and if sand is plentiful, a good aprinkling may be added about the balbe. With the soil prepared in the way auggented, little or no manure will be necessary; bat if any be given, let it be thoroughly decomposed, and either dag in deeply below the bulbe, or uned as a malch on the surface after planting. L. tigrinum (type), L. \(\mathrm{t}_{\mathrm{c}}\) splendens (a most handsome kind), and L. tigrinum flore-pleno, are all worthr, and among the cheapent of Lilies for the garden. J.

\section*{Sparaxis and Ixia.}

I am aurprined the above beautiful bulbous planta are not extensively grown in gardens, for all who have aeen a well-grown collection admit that they aro pretty wien in bloom, inexpensive to buy, and easily cultivated, thriving in almost all kinds of soil, and only requiring to be preserved from fronts. The late Mr. Gaines, a famons florint, residing at Battersea, used to cultivate the plants in capital style, be got together a splendid collection, the gracefal panicles or clasters of flowers, varying in colour from brilliant crimson to all shades of orange, red, rose, cream, \&c., which presented a beautifal picture on a border in the front of some long housen devoted to Pelargoniums. When the plants are planted in this manner in masses they rival Orchids in brilliancy. These balbs were left in the ground for three yeara, when they were lifted, worted, and the atrongest bulbs replanted. The border was protected by athick coating of old tanner's bark in winter. A wite for a bed of I xian or Sparaxis should face the south, the uabsoil should be dry, or be provided with drainage materials, such as brick-bate, laid all over the bottom of the bed; the aoil should connist of rich sandy loam, a small quantity of peat and leaf-mould, the depth being not lens than 1 foot. The bulbe may be planted in rows or clampa, from 2 to 3 inehes deap, according to their aize, covered with riversand to the depth of an inch, previons to covering them with the earth. If cultivated in pots for greenhouse decoration, the bulbe should be potted in October, and the pots planged in coal-ashen, \(8 c e\), in \(u\) cold frame till the folisgo appeare, when remoral to the greenhouse may take place, or they may remain in the frame. At the plante edivance in prowth, air muat be fivaly admitted, or the growth
will be weakly and poor ; and liquid-manare may be uned after the flower-apikes have made their appearance. In the month of May or later, when the leaves die down, tarn them ont of the soil, clean the bulbs and place them in boxen or drawers antil wanted the next Oatober. Edw. Bennett, Lyne, Chertsey.

\section*{Spanish Iris.}

All Irises are beautiful, sone of them being aurpassingly lovely, and fully jastifying their generic name ; but while the Garman bearded Iriv, I. Kæmpferi, I. reticulata, I. Sasiana, and other beantifal forms of the family are, comparatively, high in price, Iria hiapanica are so cheap, that large clumpa or bed may be planted of them at a trifing cont; they are, too, admirably adapted for catting parposes. The flowern are particularly bright and gay in colour, are borne on long atalke, and, while packing and carrying well, last a long time in water. While in bloom-about the end of May or beginning of June-they are veritable "cut and come again" plants and when grown in a ratber rich bed, well manared with old, rotted cow-dung, it it aatonishing the quantity of bloom they will prodace. Conaidering the low prics at which Spanish Irie, either in separate varieties or in mixture, are offered in the bulb catalogues, I am aurprised they are not more planted in the flower-beds or in flower-borders. As they die down after flowering, the ragged untidy appearance of a bed of German Iris when out of bloom is avoided. The present is a good time to plant them. I like to nee them in a bed by themselves, planted pretty thickly, for they do not take ap much room; but I have also seen fine effecta where a carpeting of Silene pendula compacta was put over them. I naw a bed of Spanish Iris among which Violas were planted so as to form a ground-work, and as they all bloomed at the name time, the effect was very beautifal. A. H.

\section*{FLORIBT8' FLOWERB.}

\section*{THE HOLLYHOCK.}

I have been much interested reading the remarks on the Hollyhock by "R. D.," and anc glad to know that there are cultivatora who can grow the Hollyhock aucceufally. I have been trying to grow it for the last twenty years, but I must say that my ancceas has not been conspicnoun. I can manage to get rid of the Carnation disease, and to keep it away by isolating the Carnationa, and placing every new one I obtain into quarantine ; and if the disease is there, it soon shows itself, and the diseaced portions are then cut off before the spores are developed. This is effectnal as regards the Carnation; but the same treatment will not do for the Hollyhock. Every leaf may be cat off, atill the direame will show itself whenever the firat leaves appear. I tried to grow Hollyhocks in my new place in Sarrey, and sowed reed, keeping away every plant from the place but the needlinge. They grem amazingly on the new ground, and I was in expectation of a fine bloom; but almost before the flower-buds were formed, the disease appeared. I tried the plan of removing the leaver affected, bat it was of no avail; the attack came in 1894, and was the mont viralent I ever knew. How did the planta get the direase? This was a poser for some time, until I found out that nome plante of common varieties were growing at the railway atation badly diseased; the planta were at some distance, atill the minute aporen of the disease were carried apon the clothes of the garden men, and thas it came that my plante were infected. If dieeased Hollyhocks are allowed to exist at railmay atatione, it will be hopelen to attempt the calture of this atately plant in any garden whence passengers are pansing to and fro; for I believe that the minute apores are carried on the clothes of any one going near direased plants. I am not aure what I can do next, for the plante were so bad that I destroyed them all. I have a maller lot of reedlinge, and a few named sorts, to flower next year, but I deupair of succens. A good atrain of seed is sure to
give good varieties, an about 50 per cent. of seedling Hollyhocks are as good as the parents ; and if good varieties are not produced, one knowe well enough who to blame.

As to the calture of the Hollyhock, that is nimple enough, for even in cottage gardens the most atately plants are prodaced with little trouble; neverthelena, the plant in a grose feeder, and the good reanlts obtained in cottage gardens are doabtless owing to liberal applien of pig-manure. It neeme the dieeare is inflaenced to a considerable extent by the reanons. The wet aeabon of 1894 was favourable to the development of the disease, and latt season being exceedingly dry was unfavoarable, the plants having a chance to do better if they were well watered at the roots, and the leaves kept free from red-apider. J. Douglas.

\section*{BERLIN.}

\section*{ENGLISH VERSUS GERMAN CYCLAMENS.}

To "F. N. S." I have to reply that Eaglish varieties are caltivated by Mr. Schwarzburg jast in the name way as the German ones. As I remarked in my firat letter, it may be ponible that the treatment in difforent in Eugland and in Germany. It may be also that the Eagligh varieties grow beat only under the treatment to which they are accuatomed in Eagland. The fact is, that German varietien grown together with Eaglish ones, and in the ame way, nurpase the latter. To-day I have a second proof of the trath of my remark. A second lot of seeds of Eaglish varieties was given by the Berlin Horticultural Society to another Cyclamen specialist, Mr. Tabbenthal, at Charlottenburg, near Barlin, who tested them. Thay were exhibited at the meeting of the society on the last Tharsday of November, together with varieties grown by Mr. Tabbenthal. This time the difference was still more atriking than the first time. In this case also, the English varietien had quite the mame cultivation as the home-grown ones. Mr. Schwarzbarg has reported upon the trials ; but in order that this may be quite diainterested, Mr. Schwarzburg anked the nociety to eelect a committee to teat his report and the plante. The report will be published in the Gartenflora. At this meeting it was stated that the English Cyclamen growers very much aurpased the German ones about fifteen or twenty years ago; bat since that time the German ones have progreased no far, after they introduced Eaglish Cyclamen blood into their cultivation, that they murpans the English, as is now ahown by the plante exhibited. It was remarked during the discuanion that several of the varieties which were brought to Germany fifteen or twenty yeara ago, to freshen up the German Cyclamen blood, were quite the ame as were cultivated this year from Eaglith weed. Another remark of intereat is, that German gardener: who grow new varietien give no new names to there sorte, but cultivate and improve them yearly by selecting the very best specimens for meed. So it comen about that there are in different nurseries different high-clase varieties, but without distinctive namen. If I knew on which days the meeting of the London Royal Horticaltaral Society is held, it would give me mach pleanure to send to the meeting some of our beat German varietien, as also plants of Eaglish varietien, grown here together with the German onee. Then the society could nee for itvelf whether the English varieties are bent here, and whether the German onen surpass Eaglish onea grown in their native country. On the other hand, it would be of much interest to German apecialiata if we could ree some Eaglioh-grown planta. I ber Eaglish Cyclamen apecialists who take an interent in this quention to forward to me some of their bentgrown plante, that I may show them here before our Horticaltural Society. I have further to remark that Mr. Schwarzburg is not a need-merchant; that he raises cnly as many seeds as he needs for his own cultivation, so that he cannot give aeeds to thone who have alked for them, but that Mr. Tabbenthal in willing to anply weed, as he aloo growa the plante for needs.

Chrysanthemums.-At the same meeting there were showa some Caryeanthemume by Inspector Weber of spindlerafeld. I must confegs that they now rival the Eaglish-grown plants shown some yeara ago by Euglish apecialists. There was amongat them a new variety, Tangarika, imported by the President of the German Dendrological Society, Hofmaruchall von Saint-Paul-Illaire, directiy from the Imperial Gardens at Tokio. This giant variety meanured 22 centimetre (about \(8 \frac{1}{3}\) inches) in diameter, is pare white, and of very fine habit. Hofmaruchall von Saint-Paul wrote from his revidence at Fischbach, in the Riesengebirge, that amongat the varieties he imported from Tokio there is now flowering one which has a acent very much resembling that of Violets, or even more that peculiar to the rhizomata of Iris florentina. This may, perhape, be the parent of quite a new race, welcome to all those who do not like the acent of other Chrysanthemume.
Of high interest at the ame meeting was some forced Lilac Marly, exhibited by Mr. Harms, of Hemburgh. Mr. Harme remarked, that this variety is best for early forcing. It does not need much pre-
large horticultural exhibition plants which were bought by the exhibitor ahortly before the opening of the exhibition; indeed, cases are known in which the plants were only borrowed. Thas, at our lat great exhibition in 1890, I remember that one of the jurors, the director of a famous Netherlands botanic garden, exclaimed, arprised, "How comet this plant here? There exist of this specien but one specimen, and that in in my garden." The exhibitor, questioned about the matter, declared that the head gardener had borrowed it for the exhibition. Certainly the exhibitor has no other claim to merit than that of having brought the rare plant to the exhibition. To award him a prize would be absurd, but he earna large rewards for the rich collections he has brought to the exhibition, which cannot be proved to be grown by himelf. Certainly, at an exhibition, the labour of the caltivator should win him the prize, and not the fact that he hav the longeat parae to enable him to buy ap the beat specimens from different nurmerien. It is misleading, if the exhibitor does not declare that the exhibited plants are not cultivated by himelf. The jarors cannot

Fig. 117.-liliput nastubtidm.
paration during the precoding summer, an doen Charle X. The only preparation needed in that workmen should divide the bushen in the nurwerygarden during the anmmer months. From one aquare mètre Mr. Harms raised from 60 to 90 flower-atalks. At the name time, he force three time daring one reason, so that the yield is good, eapecially as much Marly Lilac is atill imported from Paris. Dr. Udo Dammer, Friedenau, near Berlin.

\section*{A Question Relating to International Horticultural Competitions.}

In the epring of 1897, will be held, on the occanion of the eventy-fifth anniversary of the Berlin Horticaltaral Society, an international horticultural exhibition. The exhibition committee hat proponed that only ach plants as have been for at least one year, or for one cultural season, in the hands of the exbibitor, hall be admitted in competition. To this proponition considerable opponition was aroused, and the united committee of the aociety did not give their approval to it, Now the general body of the Fellow bas, at ita next meeting, to decide thether thia proposal hall be adopted or not. I think the quention of such international interest that it may be discussed in this paper. Certainly it would be a very important atep if an intervational arrangement could be made. The reavon for the proposal was, that there have been ahown at recent
know, without such a declaration, who is the grower Certainly, there will alway be some exhibitorn who will not heaitate to declare falsely that the exbibited plant were cultivated by themselven Against auch no laws can avail, but I think that a great many would be afraid to do this if there were an international agreement that all thowe exhibitor: who are convicted of having misled jaror by false declarations concerning the origin of their plavt ehall return any prize they may have wov, shall be excluded from all exhibitions, whether they be local or international onen, and that their nsmes shall be pablished in the principal horticultaral papers of the different countriea. If this resolation were an international one, the exhibitions in a thort time would be again what they once werea true nhow of plante which different gardeners have cultivated.

It was aid that the regulation that the planta mut have been under cultivation for a certain period by the exhibitor, would give occation for untruth. I may, that this can be mat by the resolus tion, that he who says that plants which the exhibitor declare to have been cultivated for the necetsary time by himelf have not been cultivated for wo long by the exhibitor, wall be confronted with the exhibitor. Then it will eavily be seen who is right. And if this were done weveral times, auch uatruthe would be checked.

There in no doubt that a great many cultivatore will exhibit their plant:, if they know that they have only to compete with other growers, avd not with thone who have elected the finent apecimena from the bet apecialiste. It is clear that againat the latter no cultivator can compete. The gardener's endeavour is to improve bis plants. He works to aell his plants. Now, there is, as regards the advancement of horticultare a great difference according to whom a grower elle his plants-to a gardener who buys them for exhibition, or to the pablic, or to amateuru. In the first case, all who do not know the origin of the plants, will think that the exhibitor of bought plants is the grower. Certainly those who wish to bay the best will go to the exhibitor, and if he would give at good plants an those which he exhibited, he is obliged to bay them from the grower. It is doabtful if he can get together much a collection a second time. At all events, the grower's name remaina unknown, and he does not get the prices for his plants which he would get if he undertook the basiness himself; oo it in to the interest of the growers that they should exhibit their plants under their own namen. It in very shortsighted to say it is the same thing if the plants are sold to another gardener or directly to the amateur. Only by direct competition between the grower is horticaltural progrens possible at local or at international exhibitions. Indeed, at the latter it is even more important than at the former; for an international exhibition is viaited by far more pertons than is a local one, and competition is greater If the larger horticultural societies in England and on the Continent would unite to work in this direc. tion, local societie would certainly follow, and then this apurious competition would noon disappear from horticultaral exhibition.

It in a queation of aecondary interest to determine how long a plant muat be caltivated by the exhibitor betore it can be admitted to an exhibition. The exbibition committee at first proposed that the planta must bo grown by the exhibitor from seede or cuttings ; but this limit wat reduced 10 that only one jear's cultivation or one cultaral period was deemed necessary. Forced plants were said at first to be admisaible when the exhibitor had forced the plants, bulbs, \&cc, himeelf. A severer rule woald necenaitate that the grower of the forced plant muat also assert his interest. An exception, it is true, muat be made for imported plante, ae well at for novelties ; but in both case it is necensary that the exhibitor declare that the plants have been imported, and how long ago they were imported, and also how long he has had the novelties in cultivaion and, if not self-grown, that he is not the grower.

At all events, horticulture would be much advanced if these proposals should find acceptance by large horticultaral ocietien. Then certainly the international character would be atill more evident than hitherto, becaune the cultivator: would know that at exhibition right hat preference over might, and that they can compgte fairly with their compeers in their own special branches of cultivation. I should be glad to hear the opinion of English gardeners on this sabject. Dr. Udo Dammer, Curator of the Royal Botanic, Garden, Berlin.

\section*{NASTURTIUM LILIPUT.}

Usder thit appropriate namo, H. Erast Benary, florite and nurneryman of Erfart, hav introduced a new variety of Tropæolum Lobbianum, very dwarf in growth, being in every reapect maller than the wellknown N. Tom Thamb, and covered with dainty little flowers in great profusion, and just showing above the amall foliage, making it one of the prettient of annalis. The flowera are of diverse coloura, nome of these being quite new, not appearing in the old varieties. This feature, and the fact that the seed. are much amaller than those, are evidences of an entirely new break in the Tropsolum Lobbianum section. Herr Benary has not an yet been able to fix the colours; but, as he says, the mixture is bighly effective in group and borders.

\section*{Plant Notes.}

BURKHILL NEW WHITE MIGNONETTE.
We have had a good many so-called white Mignonetter, at well as acarlet and other colours; bat few of these can be asid to have had a very lengthened existence. We have greatly improved the primitive type in babit, compactnese, profunion and size of blossom; but as to colour, fastion has been in farour of the original nentral tint. But this new white is pure white, with a trun of bloom that may be truly deacribed as at once bold and graceful. It may be fancy, bat I believe it is also a fact, that it is the sweetest atrain of Mignonette in the trade. I have met with it eeveral times recently in pote, and on each occasion have been most favourably impressed with it whiteness and refined fragrance. The parity of its colour will make it a mont welcome addition to bouquets, wreaths, \&c. D. T. F.

\section*{Clebodendron fallax.}

Wo find the best way to aucceed with this wellknown old atove plant is to raine plants from seed each year. A mall batch of March-sown plants is juat going ont of flower, on which are a number of seeds that will ripen in due course. The plants stand on the side atage in an intermediate-house. As stated, the seed are sown in the month of March in shallow well-drained pans filled with a light compost, and as soon as the young plante are large enough to handle, they are potted aingly into thumbs in a mixture of two-parts loam to one of rotted leaf-wil, and when these pote fill with roots, the plants are placed in 5 -inch pote in a nimilar soil, but with the addition of a small quantity of sifted fowls'dang which hat laid in a heap for nome month. Daring the summer the plante are grown in any ordinary Cacumber or Melon-pit, but not too much shaded. Is Soptember and October they add brightness to any warm plant-houe by their large ecarlet panicles of blonnow. H. J.C.

\section*{Fruit Register.}

RASPBERRY BELLE DE FONTENAY.
Tag fiae weather experienced during September and early October was favourable to autumn-fraiting Rsapberries, and I do not remember having meen Belle de Funtenay in euch fine condition as it was st that season. It is a variety that is excellent for antumb-fruiting, and is well worth cultivation if for that only, as its frait come in usefally with the retarded red Carranta. It is somewhat tart in flavour, bat not theretore dialiked at a deasert fruit. Ite requirements as to soil are similar to the summerfraiting varieties, and it should be afforded an early and ennay situation, so that its fraits, particularly in late teasons, may ripen perfectly before frot sets in. Unlike the summer Raspberries, it fraite upon the carrent year's growth, and in praning it, therefore, all its canes should bs cut down to the ground not laser thas February. The young growthe should be thinned early, leaving the atrongent to crop, and these must on no account be allowed to become crowded, bat be keps well thinaed out, so that they maygain as far as possible every banefit from the suasad air. For this reavon it is not advisable to stake them; sud, indeed, it in unnecemary to do so, as they are eturdy enough to be self-supporting, and it that left alone they naturally arch, and fully expose their flowers and fruit. Thomas Coomber.

\section*{Gaakd Duke Plum.}

A: alate bleck variety, we like this Plum very much. It reacmbles Dismond in appearanise, but the frait has heavier bloom, and at Mereworth it is if far better flavour, and the tree growing on a west wall, crop freely. The frait have the good charecterisic of keeping for a long time after ripening without meivelliag; in thort, it is mout valuable Plum. The variety was raised by Mr.

Rivers, Sawbridgeworth. It is a seedling from Autumn Compote, and ripens from the 10th to 20th of October.

\section*{Apple, Newton Wonder.}

This comparatively new introdaction of Mesare. Pearson, of Chilwell, is apparently a cross between the Blenheim Orange Pippin and Wellington, having a resemblance to both these varieties. I havenot as yet grown it, but it good qualities are highly spoken of by Mearr. G. Bunyard, at whose nursery plece I recently anw some heavy and handsome fruits. If the trees bear early, and are fairly free from canter, then we have in Newton Wonder a first-rate Apple, which can be kept in sound condition till the month of May. It was exhibited by the raiser before the Royal Horticultural Society in 1887, receiving a First-class Certificate. It is said to be eminently suited to cold oils and districts. H. Markham, Mereworth Casthe, Kent.

\section*{The Week's Work.}

\section*{THE OFCHID HOUSBB.}

By W. H. Whits, Orchid Grower, Burford, Dorking.
CCELOGYNE GRI8TATA, ETC.-Plant of this winter-fowering Orchid are howing flower-mpikes already, and where there are aeveral apecimena, long auccession of flowera will be afforded if one or more of them are placed in a slightly warmer aituation than the others. At this period the caltivator should guard againat over- watering the plants, or sprinkling the bloom-spikes, these being liable to rot away if moisture accumalates about them. Just before the flowers open, afford the plants a thorough soaking of weak liquid manare-water to ansiat their development. C. ccellata maxima and C. elata are also pushing up their flower-spikes, and need to be copiously watered till the flowera fade; C. Alaccida, C. Mansangeana, and C. tomentosa, are at rest, requiring very little water at the root before flowerspike appear, or growth recommencea. Spscies that have bloomed recently, as C. Rossiana, C. Cummingii, C. graminifolia, and C. aulphurea, may be re-potted if they require it.

MAXILLARIA,-Among plants in flower in the pretty Maxillaria lepidota, who bloomm, although of amall wize, last a long time in perfection, and a strong plant here with over 100 blooms open is regarded as a very effective feature at this season. M. picta, not so showy as the first-named flower, also in flower, is as interesting, and on that account worth growing, as also for it delightful fragrance. Such handeome and atrong-growing species an M. grandifora and M. venusta that have jast pasmed cut of flower should be examined, and it greater root-space be needed, it should bs afforded. Orergrown plants, or those whose central growth have become much crowded, may be divided, and made ap into small, compact specimens, or re-potted as single pieces. Maxillarian rfquire liberal root-watering and a moist atmosphers when making growth; and it is important when repottiog them to have the pota well drained. The compost should connist of one-third good fibrous peat and two-thirde sphagnummoss, with plenty of mall crock intermixed. Pot somewhat firmly, and keep the base of the plant a little above the rim of the pot. It in not advisable to afford the plant a heavy watering for a few weeks after diaturbance, but oprinkle the aurface of the compont, so as to keep life in the aphagaum-moss. When new growths are observed to push out roote, the quantity of water may bo alightly increased. A light part of the cool-house is the proper place for there plant the whole jear.

ONCIDIUM INCURVUM.-This in a graceful and pretty Orchid, when well bloomed, that is now starting to grow, and hould, if necessary, be repotted, using the same kind of compost as that recommended for Maxillarias. Both geners grow thoronghly well together, at they need an identical trestment. Oacidium ornithorhyncum has also just passed out of flower, and may now be aupplied with fresh material to root into. This species nacceeds in the cool-house in summer; bat in winter it thould be placed with Mittonim vexillaria in the intermediate-house.

MILTONIAS - The majority of the Brazilian Miltoniap, viz, M. spectabilis, M. Moreliana, M. candids, M. bicolor, M. Peeteraiana, M. Clowenii, M, caneats, M. Rassellians, M. Regrellii, \&c., will now
be reating, and until growth recommences they should be kept comparatively dry at the roots. Keep them in the coolent part of the intermediate-hoase daring winter, where they will obtain as much light as poasible. Uafortunstely, these planta are seldom kept in a healthy and matiafactory condition. The principal cause of failure in our own case has been the use of anaitable material for them to root in. I find they thrive bent in good fibrous peat from which all the fine matter has been sifted out. Use no sphagnum-moss, bat mix plenty of broken crock: with the paat. In auch material they can be watered very freely, and daring the growing season this is ensential. The water passes quickly away, and the risk of damp in bulbs or foliage, and decay at the roots, is practically avoided. Supply fresh material when new growth commerces. The dwarf-growing varieties, an M. pectabilip, \&c., may be put in shallow pans, and nopended to the roof; but others are best grown in pots, and kept well above the rim. M. Schroderiana, a rare and haodeome apecies, is in full growth, and should be given the warm temperature of the East Indianhouse daring the winter month. When the new bulbs are matured, it may be removed to the Cattleya or intermedate-hoase to rest and flower.

FRUITS UNDER GLASE.
By biohard Pareer, Gardener, Goodwood, Chichester.
THE EARLY VINERY, - This house bting now closed for the forcing of the Vines, great care will be needed to enare all the bad breaking regularly, therefore no fire-heat will be needed for the first few days, and this is the more important if the canes are young and have not been forced before. If the canea are trong and well ripentd, and the precantion taken to bend them down that the apex will be as low as the lowest fruiting spur, they may so remain till it is seen that every prominent bud has started. In oar early vinery, the Vines are planted in a narrow border, which received a thorough watering when the honse was closed; and the canes will be kept fairly moist by aringing them regularly once or twice daily, accordingly as the weather in dall or bright; no more root-watering will be applied until active growth begins, after which time tepid water will be used alwayn. In the absence of frost, no \(d\) fficulty will be found in keeping the temperature at \(55^{\circ}\) to \(60^{\circ}\) during the day, with jast a slight amount of circalation in the hot-water pipes, and for ten days or a tortnight this temperature hould not be exceeded. The night temperature may range from \(48^{\circ}\) to \(50^{\circ}\). If the roof can be covered at night with thick canvas or other material, it will be an advantage. These tempersturen can be secured in mild weather by the sole use of a bed or two of fermenting materials, placed in the house, the moist heat of which greatly assist the breaking of the canes.

8econd vinery.-These Vinea ahould now be pruned, and the huuse got in readinesi for a start being made at or about the New Year. Oar Vines in the second early vinery are forty years old, and with a view of affording fresh vigour to them with ut replanting, every alternate cane was cut back to the bottom wire lat winter, and from there old stems vigorous canes have been secured, which are in a well-ripened condition. These canes will not be cut back very much, bat from 8 to 10 feet of cane will be left, from each of which I hope to take from two to four bunches next acason. To make room for the development of theae young canen, the lower spurs on the eld Vines will be sawed (ff at far up an may be necenary to allow apace for the side shoots of the yoang canen to grow. The top parts of the old Vines will be cropped until such time as the young ones come into fall baring. when these in their turn will be cut beck in the same manner. As the Vine border in this house wan recently re-made, nothing is required in the Way of preparation beyond raking off the rabbish and levelling the rough eurface. After a time the arface-soil will be lightly broken with a fork, and a dreasing of Thomen's Vine-manure applied.

STRAWBERRIE8. - For the earliest batch, make une of the variety Vicomtese Hericart De Thury potted in 5 -inch pots, which cennot be beaten for early fruiting. Prepare them by planging the pots to the rim in a bottom-heat of \(70^{\circ}\) to \(75^{\circ}\) afforded by a bed of leaves, or leave three quartern, and atable litter one quarter. This ahould be made up in a pit, capable of being heated, if necensary. Bring the bed pretty close to the glaes, and afford a top-hest of about \(55^{\circ}\). By
this kind of treatment the plants make strong growth, and by bringing them on slowly the flowertrusses are strong and carried well up above the
foliage. Ventilation munt be afforded to get rid of rank steam, otherwise injury will be done; in fact, a chink may be left on alway if there is any fear that the temperatare will rise above the point recommended. The lights should be covered with dooble mats on frosty nights, the plant being exposed to the light early in the day. I prefer to surface-dress the plants when the fruit is set, bat it may be done when the plants are brought in.

\section*{THE ELOW GR GARDSN.}

\section*{By Baiter Wadds, Gardener, Birdsall Gardens, Fork.}
cutting evergreens.-If the weather continue favourable, advantage should be taken of it to thin oat and prane Laarels, Box (bat not clipping the leaves of this last). Hollies, and other evergreen shrabs. The pranings being in demand at this tesson for decorative purposes, should be saved by inserting them in damp soil. Together with these may be atsociated in decoration Sprace Fir branchlets and Ivg, all of which should bs secured and kepts in readiness for use. To many of us this meason brings a great deal of work in the matter of wreathmaking for a variety of purposes; and when the day are fine, it is a good plan to gather in as mach material as will ba required, it not being an agreesble job to gather it when the trees and shrabs are covered with now or rain is falling. The work of cotting decorations require careful doing, or much damage is done, therefore get it through in fine weather if possible and in adrance of the time. As material for wreaths for twining round pillars, nothing looks so well as small shoots of Holly, furnished with berries; heavy wreath for the tops of screens or walls should be made of Mahonia, Spruce Fir, Box, and Ivy, and when the Holly is well-berried, large branches may be cut from trees growing in out-of-the-way places. Care is necesary in fixing Holly branches in position, as they should not be placed so low that persons can bruah against them, or damage may be done to the pictures by the leaves, or to carpets by the fallen berrie. For bright green foliage the Common Larurel is one of the best.
everareena by parcel post.-Package of thes may be sent without much damage if a piece of stick or light lath cut a little longer than the parcel to be sent, so as jast to stick out at each ead. Lay the tick on a sheet of newspaper, then lay the evergreens, Misleto, Holly, Fern, or even flowers, in the middle of the parcel, and tie carefully with the evergreens packed all round the flowers, making the outer covering fast to each end of the lath. In this way the decorative materials that are so highly prized by townsfolk at this feative season may be nent by post for little cost, and there are no boxen to be retarned.

HELLEBORUB NIGER AND OTHER SPECIES.-Bell-glasses, hand-lights, or garden-frames should bo placed over the roots of the first-named growing in the borders, so as to protect the blooms from now and rain. Clamps may also ba potted in andivided masses, and placed in an intermediatehoase ; the best variety for this purpose is H. anguttifolia -a fine pare white-flowering variety in mach request at this season. It can, with a little heat, be quickly brought into flower. There are several fine varieties worthy of a place in the herbaceous toil be well drained and rich. They are readily increased by divisions and by eeda. For flowering daring the winter and early spring they whould bo planted in sitastions sheltered from the north and eart. Valuable varietie are H. maximat, H, M, leciniatas, H. niger Mne. Fourcade, H. gatatas, H.
olympicus, H. orientalis, H. D. Moose, H. palliolympicus, H. orievtalis, H. D. Moose, H. palli-
dus, and H. p. alba. The more ahrubby varieties, viz, H. "ootidus and H. trifolia', have beautiful foliage.

\section*{TGE HARDY FRUIT GARDE世, \\ \section*{Hy W. Pope, Gardener, Highelere Castle, Newbury.}}

FRUIT CORDONs. - The utility of cordons shoald frait trees, for not of by the intending planter of frait trees, for not only do such forms of fruit trees come quickly into bearing and generally afford the to fill ap emall vacant spaces on walle or fonces Which would otherwise be left unoccupied. Where when wand otherwise be left anoccupied. Where
trained trees or of maidens ahould be made, planting
them as early as possible. them as early as ponsible.

\section*{PRUNING SWEET CHERRIE8 AND PLUM TREES, -} These trees, although differing much in character of growth, require a somewhat similar treatment in the matter of proning and training. The fruit being in both case produced on spars, the breastwood and lateral growth on the main branches thould be shortened to a couple of buds, and the leading shoots laid in where required, care being taken to avoid crowding the shoots in any part. Pyramids or bushes thould have all the lateral hoot not required for furnishing the trees, sparred back to near the main branches, and the leading growth shortened more or less according to atrength, in the case of side branche to an outside bad, or if very atout and sturdy, they may sometimes be left anshortened. Keep the \(\mathrm{c}=\mathrm{ntres}\) of the heade thin, othat light mas penetrate to the inner parts. Scandarda, eapecially of Plama, rfquire frequent attention in the matter of thinning, or in fem years, if this be neglected, the whole interior parts of the tree will be fraitless.

Morello Cherries form very pretty and profitable pyramid or bushes if proper attention ba given to the necestary pinching once or twice daring the sammer. At the present seaton the young shoots on these must not be shortened, but merely thinned by catting out the weak and badly-plact d ones. As regarde wall trees of the Morello, mach of the old wood may afely be removed and replaced with young growth. An error often made is to train-in the bearing-wood mach too closely, for as a rule each fraiting-shoot ought to be allowed from \(4 \frac{1}{\text { a }}\) to 6 icchen apace on each side. Spara ahould be thinned in number, those retained being close to the wall, and not allowed to extend themselves so a to form breastwood.
manuring the fruit quarters.-Advantage thould be taken of frouty weather to wheel manare to the Gooseberry and Carrant quartere, lightly forking it into the groand, so as to jast pat it out of aight. Raspberry plantations, if long planted, should have a heavy dreasing of farm-yard manure applied as a mulch. New plantation may not require more than will manare the lines of plants for a distance of 1 foot on each side of the same. This will serve at the same time to protact the roote from hard froste. Daring open weather, liquid-manure should be applied to the roots of old orchard or eatablished fruit-trees elsewhere, such as wall-trees which are weakly, or fail to finish their cropi natisfactorily. Before applying duag to these last, the soil should ba drawn away down to the surface-roots, and farmyard drainage-water in quantity afforded; the soil hould then be returned over them, and the top-dressing put on.

\section*{THE KITCEEN GABDEN.}

By Joun Lambirt Gardener, Powis Cantle, Welshpool.
EARLY POTATO8.-Where the earliest batch of new Potatos is obtained from plants grown in flowerpote, preparations for a start may soon be made. The pots should not be less than 9 or more than 10 inches in diameter. They should be well washed out, and the botsom covered with a \(1 \frac{1}{2}\)-inch layer of crocks, and these covered with some of the coarser portion of the leaf-mould. As a potting-compost, the now mellow losm that formed the beds on which Melons were grown will be very anitable, if a small amount of leaf-mould or Mashroom-bed manure be added, together with charred earth, \&c., filling the flower-pots to three-quarters of their depth. Place the set-preferably an uncat one-sa inch deep in the middle. A Peach-house or vinery just atarted to force will be auitable for the pots. If the soil is moist when used, no water will be required by the aets before growth appears, and when that occurs, place them as near as possible to the roof-glan, so that they may grow short-topped sad stardy. When of safficient height, Gill up with warmed soil to within an inch of the rim. At this period a thorough watering of the mill with tepid water may take place. Oae advantage of forcing the Posato in flower-pote, is that they can be accommodased in places which would scarcely be oceupied with other plants; and I have seen some fairly good results come from the following method. The method parsued is to plant in pite capable of being heated, or wooden frames atanding on hot bods of dang and leavea, and for the earliest crop the heated pit is preferable. Pits and frames ahould be whitewashed, in the care of the former, and scoured with sosp-and-water in that of the latter, and thea filled with woll prepared hot-bed materialb, vizo,
atable litter and tree leaves, or the latter alone, made quite molid by treading them evenly all over. Before putting on the soil, the warmth thould bs on the rise, and thould the bed have sank mach, enough prepared materiale should be placed on the saríace and trodden down as before, and to such a depth that the bed of soil will not be more than 6 or 8 inches from the glase. The compost for use in hot-beds is the wame as that advised for Potato in pots, and it should not be of les depth than 8 inches. When the toil has becom Warm, aly \(75^{\circ}\), which is about the proper temperatare. the net. may be planted. 'To eave time, place a nufficient number of selected sets in boxe or mall pots, covering them with leaf-mould, and set them to sprout in mild heat. These when transplanted will have a good bit of leaf-soil adhering to the roots, and will not be mach checked in growth by removal. Piant in rows 2 feet apart, and from 9 to 10 inche apart in the row. Grow the planta quickly, bat do not let them become drawn by tou much warmth, or the exciualon of light and air. Some gardeners sow Radishes betwepa the rows, but it seldom pays to do so, a the Radishea grow mach better by themselves. The following are pxcellent forcing varieties, viz, Sharpe's Victor and Veitch's thort-top Ashleaf.

\section*{PLANTS UNDER GLABB.}

\section*{By W. H. Surter, Gardener, West Dean Paph, Chieherter.}

FORCING HOUBE.-The plants which may be brought into the forcing. house, viseries, or peacheries, consiat of Lilacs, Deufzias, Roses, Hoteia japonica, Azalea indica, A. mollia, Ghent varieties, and Roman Hyacinthe, and these being kiads that require but a small degree of heat to bring them into flower, are the betfor the mid-winter season. The flowere will endare a much lenger time if the plant are brought into a lest warm house or pit when these are about to expand. At this date Lily of the Valley crown are flowering capitally well, owing to their being thorougbly mstared. The pots containing the crowns, if they are forced in this manner, and not in boxes, ahould be p'uaged in the hottent part of the bed, and afforded plenty of warm

Chrybanthemums.-Most of the Chryasntbemum plants will shortly be out of fower; and it will require in most places a good deal of forethought and good management to maintain a gay appearance in the conservatory, and to supply flowers eisewhere daring the next two month. The following kinds of balbn, viz, Narcinan, Tulip, Scillan, Irin, and Jonquil, are useful in a variety of ways and easily forced into fower, and these, like others, are the better for being brought into a lower temperatare than that of the forcing-house, to open their blossoms. If clump of Christmas Rose are taken up and placed in a warm greenhouse, they will quickly come iato flower; and the pare white flowers are alway mach admired, and useful in a variety of waye.

POINEETTIA PULCHERRIMA. - The stronger plants, whose head have been removed, whould alway be asped for increase of atock, aud they may at once be stowed away beneath the greenhouse or stove-ntages, or other frout-proof, dry aituation. The gaps made by their removal may be filled with others that have been suitably prepared in an intermediate-bouse.

RICHARDIAB.-All the well-rooted plante should receive plenty of manure-water, and any which are throwing up spathes may be placed in a warmer horse than that they now occupy. Famigate the plants once in three week to destroy aphia, which, if namolested, soon upoil the apathes.
oeneral hints.-Named Hyacinth, late Talip, and \(D_{3} f f o d i l\) bulbe at the prewent time planged in coal-anhes out-of-doors or in frames, shonld be oceaaionally examined, and all thoe which have commerced to grow at the top and have plenty of roots ahould be removed to cold frames or the greenhouse, and isured by degrees to aunlight. Italian Hyacinths anceed the Roman variety, and the blonsoms are uwefal material for light decorative parposes. Koep Violets in frames free from decayed leares, and if any of the plante show aigne of dampiag, dust them wilh charcoal-powder, acd draw off the frame-lighte in mild weather. If froat threatens, place litter roand the frames and cover up warmly. The present is a suitable ceason for obtaining loam, pest, sud, aphagnum and other moss, flower-nticks, \&c., al d leaf-soil.

\section*{EDITORIAL NOTICES.}

Letters for Publication - All communications intended for publication, as well as specimens and plants for noming, should be addressed to the Editor, 41. Wellington Street, Covent Garden, London. Communications should be WRITTEA ON ONE SLDE ONLT OF THE PAPER, sent as early in the week as possible, and duly signed by the woriter. If desired, the signature will not be printed, but kept as a guarantes of good faith. The Editor does not undertake to pay for any contributions, or to return unused communications or illuctrations, unlese by special arrangement.
appointments for the ensuing week.

CORRECTED AVERAGE TEMPERATURE FOR THE ENSU ING WEEK, DEDUCED FROM TRE OBSERVATIONS OF FORTY-THRRE YEABS, AT CHISWICK.-40.

\section*{Potatog.}

Under the auspices of the Teohnioal Education Committee of the Surrey County Counoil, Mr. Joun Wright condacted a series of experiments, with a view of ascertaining for different localities and various soils, the best croppers and the best varieties generally. The report is now before us, and very interesting it must be for the cultivator. The experiments were conducted in ten different localities, and the results were oompared by means of samples got together and exhibited in the public hall at Carshalton, on October 16 and 17. Two hundred and twenty dishes of Potatos were shown, the tabers being exhibited as taken up, and a sample of the soil upon which they had been grown was placed beside them, The smallest but most shapely came from the ohalky soil, the largest from the clay and peat, whilst those from the sand were the most soabbed. A selection from the best was cooked, with varying results, as might be expected from all the tabers being cooked at the same time withoat reference to their matarity. We cannot give all the details of these interesting trials, bat
their general character may be gleaned from the following extract:-
For good shape, thirty varietien were chosen from the entire exhibition. Of these, Chancellior was found in zeven collection from as many centres. Satisfaction in six. Goldfinder in five. Renown and Windsor Castle, each, in four collections. The Brace, Prime Minister, The Canon, Triamph, and Congress, in three collections. Sapreme, Dreadnought, Colomal, Best of All, White Perfection, and Victory in two collections. Only one dish each of the remaining fourteen varieties was chosen from the whole of the samples displayed.
For quality, Goldfinder, Sapreme, and Satisfaction were the beat from dark, boggy soil. Windsor Castle, Satiafaction, and Renown from clay soil. Sapreme, Satisfaction, and The Bruce from dark, sandy soil. Colosasl, Satisfaction, and Windaor Caatle from chalky oil. Challenger, Chancellor, and Duke of York (early) from sandy-peat soil. Fature Fame, Satisfaction, and Beat of All from gravelly moil. Triumph, Satiofaction, and Windeor Caatle from marly ail. Victory, Early Regent, and Dean's Renown from loose and. Trinmph, Victory, and Satisfaction from atrong loam, Paritan (early), Windsor Castle, and Dean's Renown from dark porous soil.
Taber of good shape and marketable appearance were chosen from foarteen other varieties, bat these when cooked were foand generally deficient in quality. As in the case of at least some of these, the reaults were, in all probability, the consequence of anipeness-their beat cooking season not having arrived-it would be premature to pablish their names, and thus imply, an later experience might prove, unmerited condemnation. Also, it should be atated, that atill more varieties afforded good cropa in the bulk, jet the tubers were more or less unshapely, and therefore not cooked. As there is reason to infer that thene were in a large degree prejadiced by the second wwelling after the rainf, which was more apparent in some soils and localities than others, the varieties are reserved for farther trial prior to the pablication of their names.
As only in one district (embracing Mitcham and Bandon Hill) exactly the same varieties were grown in four distinct kinds of ail-bog, cley, sand, and chalk, these trials obviously afford the beat basia for comparison as to the relative adaptability of the varieties to soilr of the natare indicated. The reanalta, both as to the character of the samplea in appearance, and their condition when cooked, are shown in the following summary :-

Sumyary of samples amd Cooking quality of Varieties grown under Identical Conditions in the

\end{tabular}

The coolving qualities of varieties that wore not grown for coor parison in the particular soils specified, may be seen on were not good enough for cookiug iad the particular foilentres (pp. 4, 5, and 6). The blanks in the table indicate that the samples

If the whole of the varieties could be cooked in January or February by the asme qualified official who exercised so mach kill and care in October, somewhat different results might be expected, for, as previously indicated, some of the most uneful late Potatos do not develop their bent qualities till they have been atored for aeveral weeks or month, and if some of the exhibited samples conld be apared from the analysis to which they (alao the soil) are to be abjected, a second trial as suggested would complete the tent of their relative culinary value. For the puppose of cooking, Potatos should be kept ia a dark place; for planting, they are better where light can reach them, but in both cases they must be kept cool pet abolately afe from frost.

\section*{Manure Trials at Richmond.}

The long drought was antagonistic to the inflaence of chemical manares, that the effect of the different mixtures were not adequately declared. Four varietien, twenty-five equal mized eets of each, weighing in the aggregate 3 lb ., were dressed with chemical at the time of planting. There was, for the reason atated, comparatively little difference in the resulte, and it will anffice to give the malleat and greatest yield in each case.
Renown (Webb's). -"No manure
25 lb

> Equal parts sitrate of soda and super-phosphate... ...

White Perfection.-"No manure"
A 1 potato manare

> Magnum Bonum.-"No manare"
> Equal part kainit, auper phosphate and nitrate of moda
> Chancellor.-" No manure "... Sulphate of ammonia 44 "
> 3 part kainit, 1 part each of aper-phosphate, and nitrate of ada

The mineral manure were applied at the rate of 4 lb ., the nitrogenous kinds at 1 lb . per rod. No farmyard manure was used.

WITH the last meeting of the
The R H. S. year, comes also the dissolution of the several oommittees. Prior to their dispersal the committees are asked to suggest the names of members for the reconstruction of the committees in the ensuing year. As there are no limitations, excepting that the new Members proposed must be Fellows of the Society, it is a misfortune when the members do not use their privilege, if only to neatralise the prejudice that some people still indulge in, that provincial interests are not sufficiently studied by the Society. Time and space are after all not quite obliterated, and a gentleman living in Scotland or Ireland can hardly be expected to attend so frequently as his brethren who live nearer the centre. But to suppose, as we sometimes hear, that provincial exhibitors, provinoial committee men, or provinoial exhibits are, apart from those considerations of time and distance that we have alluded to, in any wise differently treated from others, is a mistalie that cannot be too emphatically contradioted. A much larger infusion of new members would be desirable in all the committees, but it is difficult to see how this object is to be attained, particularly when the members of the existing committees do not more freely exercise their privilege of suggesting new members, and when the Council do not more rigorously enforce the principle of retirement of older ones by rotation.

Again, the amateur, as distinguished from the commercial element, requires to be mnoh strengthened. Perhaps this could be done through the mediam of the Scientific Committee, to whom might be allotted the task of dealing with plants andexhibits not directly of commercial interest. At present the Soientifio Committee con-

Fig. 118.- roddemania triloba: flowief of katural bre, oramar.colourmp.
sists too exclasively of experts who act as referees in chemistry, entomology, and other scienoes, but who are not specially interested in horticalture. It was not so in old days, when suoh men as Wilson-Saundrrs, Elwre, Boscawen, Mangles, Geo. Maw, Sir Charles Strickland, and other enthusiastio amateurs took part in the meetings. Another means of strengthening the societies would be the establishment of local committees, according to circumstances, in connection with the provincial hortioultural sooieties, such committees to be in constant touch with those in London, and entitled to send representatives to any of the London meetinge. In this way the deplorable waste of energy and opportunities manifested in local exhibitions misht be reduced, horticaltural progress, rather than the benefit of exbibitors, or the amusement of visitors, made the prinoipal object, and a higher tone generally introduced, whilst the wants and requirements of the provinoes would be better made known at headquarters than is the case at present.

But these are subjects which we cannot now further dilate upon. Our main objeot in alluding to the meetings of the Committees on Tuesday last, is to point out that in the case of the Fruit Committee, at any rate, the occasion was historio. On that day Mr. Barron retired from his position as secretary, a post he has held since 1865. Votes of thanks to the members of the several committees and to their respeotive chairmen and secretaries were matters of course; bat, in the case of Mr, Barron, warmer, more special feeling prevailed, which found partial expression in the sabjoined resolution, and which will be accentuated when an occasion will shortly be taken to show how thoroughly the horticulturists of the country appreciate the labours of \(\mathbf{M r}\). Babron. The resolation referred to was most fitly proposed by our leading Pomologist, Dr. Hogg, who traced the history of the Pomologioal Society till its absorption in 1865 into the Royal Hortioultaral Society, where it now flourishes as the Fruit Committee:-
Proposed by Dr. Hoga, seconded by Mr. J. Smith (Mentmore)-"This Committee desires to record its high sense of the valusble services which Mr. Barron has rendered to it daring his long occupation of the position of Seoretary, from which he is now retiring, and to congratulate him on the distinction of having been placed by the Council on the roll of Honorary Fellows of the Royal Horticultural Society. The Committee will also heartily weloome him to a seat at this table, and expresses an earnest hope that he may long enjoy health and happiness, and find many opportnnities for continuing to render distinguished servioe to horticulture and to the Sosiety."

Luddemania triloba (Rolfe, m. sp.). - Thir beantiful species is one of the recent diecoveries of Consul F. C. Lbemann in the Andes of Colombia, and it has been flowered and twice exhibited before the Orchid Committee of the Royal Horticultaral Society by Sir Travor Lawprever, Bath On the lat occaion (November 16) the fine plant from which our illuatrstion (6g. 118) wat taken was hown, and wat unanimounly wrarded a Firatclasi Certificate. Luddemania trilobs it a plant of conaiderable floral beanty, at well an one of remarlable botanical intereat. The plant had a pendalous inflorencence over 2 feet in length, and bearing thirty-three wax-like flowern of bright orange colour, the sepals being tinged with copper-brown, and the base of the lip, which is diatinctly threelobed, having a dark parple blotch. By reference to our illutration, it will be seen that the plant requirea to be grown in a bakket, if for no other reason than to allow of the proper diaplay of ite
inforeacence. The bestsituation for it is the inter-mediate-honse, and in its culture it has the same requirements as the Acinetas.

Our Almanack.-Secretarien of Horticultaral Societies and othern, are earneatly requeated to forward immediately, the dates of Show Fixtures and of Meetinge of Botanical and Horticaltaral Societies of any kind for 1896 , for insertion in the Almansck, to be pablished in our iunue for January 4.

Linnean Society.-On the occasion of the meeting held on Tharaday, December 5, C. B. Clarke, FRS., President, in the chair, Menars. Bernard Arnold and Rapert Vallentin were admitted, and the following were elected Fellown of the society: W. M. Cariaty, Rev. H. P. Fitzgerald, A. W. Geffeken, Rev. E. A. Peacock, R:v. T. R. Stebbing, and W. O. Stentiford. The president called attention to a portrait of the late Prof. Babington, of Cambridge, which had been lately presented by hia widow to the nociety. On the motion of Dr. Marie, seconded by Mr. A. W. Bennett, a vote of thanke to Mra. Babington was ananimoualy accorded. Prof. Stewart offered wome remarks on the types of the axes of certain Gorgonacem, in which he referred chiefly to the importance or otherwise of the premence of spicales in the axem, and exhibited the following apecies in illastration of his remarks:-Paragorgia arborea, Melitodes ochracea, Saberogorgia auberosa, Corallium rubrum, Caligorgia verticillata, Verucella guadalupenais, Iain hippuriv, Plexanrella crassa, and Eanicella verracosa. Some criticism wat offered by Dr. Marie, chielly in relation to the atructure of Gorgonia flabellum and Gorgonia metona. Mr. Martin Woodward exhibited and made remarks on a living apecimen of Oarawobs, which he thought should be regarded at a common Arooba attacked by a parasitic fuagus. Mr. G. C. Drace communicated a paper on a new apeaies of Broman in Britain, which was'said to diffor from othere of the genus in its infiorescence, having single-shoot stiff pedicel arising alternately right and left of the main rachis, each bearing at it extremity 3-5 sesnile, or, in some casen, shortlyatalked apikelet, giving an interrupted and compact appearance to the whole inflorescence, which is made up of two rows of cluatered groups of 3-5 spikelets. This peculiar featare being absent in its nearent allies, the name interruptus was proposed to diatingaish it. It appeared to have been described or referred to by Professor Hackel as Bromas mollis var, interruptue; bat Mr. Druce considered that it wat nefficiently diatinct to be entitled to apecific rank. He had found it growing abundantly in a field of Vetcher near Upton, Berkshire, and apecimens had been examined from Headington, Oxford, and Dartford, Kent. In a discuasion which followed, Dr. O. Stapf reviewed the literature of the nabject, and gave reasonn for regarding the co-called new species as merely an abnormal growth of Bromus mollis. Critical remarke were made also by Mr. H. Groves and Mr. A. B. Rendle, who were inclined to share the opinion of the last apeaker.
- An evening meeting will be held on Tharsday, Dec. 19, 1895, at 8 P.M., when the following papery will be read:-1., R. A. Bolpe. AL.S., "A Revieion of the Genui Vanilla;" II. E. S. Goopmer, F.L.S "Oa the Cephalopode collected during the Vogage of H.M S. Ineestigator."
national Chrysanthemum Society.-A weli-attended meeting of the General Committee took place at Anderton's Hotel, Fleet Street, on the 9 sh inst., Mr. B. Wrnse in the chair. After dealing with some correspondence, the Secretary reported that the amouat of prize-money amarded at the Dacember show amounted to £51 4s.6d. The awards of medals made by the Arbitration Committes to miacellaneous sutjacts at the asme exhibition were approved. It wasd cided to recommend to the snausl geaeral meeting the appointment of three auditors inatoad of two only, as at present; one to retire annaally, and be eligible for re-election for one year. This increase in made necassary by the growth of the oclety. The Secretary brought
up a reconmendation to the General Committee from the Jabilee Sub-committee, that for the future, in all clases in which Japanese Chryanthemama are required to be ahown on boards, the boarde for twelve blooms shall be 28 inches in length by 21 inches in depth from back to front; the holes for the tobes to be 7 inches apart from centre to centre; the height at the back to be 7 inches. This was carrit d. It will be underatood that as the size for a twelve-bloom board oaly is given, it is yet intended to apply to all larger collections. It was arranged that the annual general metting whould take place on February 24 ; the audit of the accounta being held a week previously. It was agreed, aubject to the approval of the managers of the Royal Aquarium, that an exhibition of early Carysanthemums, Dahlias, \&c., hould take place on Soptember 9, 10, and 11, add an early autumn thow on October 6, 7, and 8 , and the mid-winter ahow on Dacember 1,2 , and 3 It was also resolved that the anm of \(£ 20\) should be offered for early Chryeanthemams in September, and £10 toward the Dahlia prizen. The dates of the Jubilee exhibition are November \(3,4,5\), and 6. Five Fellows and thirty-four ordinary nembers were elected, bringing the total number of new members for the year up to 162. Three ocietien were also admitted to affiliation. A vote of thank was passed to the chairman for presiding.

The Botanical maqazine."-The dedica. tion of the annual volumes of our venerated contemporary has become a matter of much interest to botanista and horticalturista. This year the honoar falla to the share of Mr. Harry Bolus of Cape Town, whose work: on South African Orchid especially, amply entitle him to the warment compliment that his colleagues can pay him. The plants figured in the current namber are :-

Streptocarpus Wendlandi. Hort. Dammann, ex W. Watson, in Gardenerg' Chronicle, 1894, i. 590, t. 7447, a magnificent apecier, the parent of S. Dgeri \(\lambda\).

Aloe Luntii, Baker, t. 7448.-A highly intereating species, discovered in Southern Arabia by Mr. Lunt, Tae atems are short, bearing at the top a tuft of long linear-lanceolate recurved fleshy leaven, deatitute of spines at the margin. The flower-paaicle is loosely branched, and bearn numerous tubular pink flowers tipped with green. Each flower is about 1 inch long ( 25 cent.).
Buddleia Colvilei, Hook, fil, and Thome., t. 7449. The handsomest of all Himalayan shrabs, with pendalous masses of rose-purple or crimson flowers, relieved by the dark green foliage.
Bartholina pectinata, R. Brown, t. 7450. An extraordinary little terreatrial Orchid, from the Cape of Good Hope, with tuberous roots, an erect ilender hairy atem, only 3 to 4 inchen ( 80 to 100 mill.) in height, and a solitary roundiah thick leaf, spreading on the surface of the ground. The flowers are 2 to 3 inchen ( 50 to 80 mill.) across, with erect linear lanceolate greenish aepals, shorter than the very narrow erect whitiah petals, lip 50 cent. across (2 inches), fan-shaped, white, dividing about halfway down into numerous linear fringe-like apreading segments.
Musa rubra, Wallich, t. 7451.-A specio with a atem 5 to 7 feet high; lespes, 4 to 6 feet ( \(1 \frac{1}{2}\) to 2 met.), long oblong lanceolate acuminate. Bract bright red, with obtuse golden tips; flowers tubular, yellowith, 1 to \(1 \frac{1}{5}\) inch long ( 35 mill.) ; the femalen rather shorter than the males.

Gardeners' Royal Benevolent Institu-TION.-We are requested to atate that the committee have gratefally received the sum of \(£ 2573\). bdo, being a proportionate amount of the fand raised to perpotuate the memory of the late Mr. Wm. Thomson, of Clovenfords, to be invented and known henceforth sis the "Wm. Thomson Memorial Fund.

National Rose Society. - A copy of the balance-sheet, duly attented, has been sent to us. It show that the receipts, including balance from lat account of \(\mathrm{f} 72 \mathrm{1ls} 9 \mathrm{~d}\), amounted to \(\mathrm{E} 788 \mathrm{Os}, 7 \mathrm{Z}\). The balance et the banker's in £45 148. 3d., the total
xpenditure being \(£ 742\) 6s. 4 d. No lezs a sum than \(£ 250\) 10s. was diatrionted in prizes at the Cryatal Palace.

Handbuch der Praktigchen ZimmerGärtnerel" (House-Gardening).-We menuun this German treatise by reason of the excellent illustrations, which convey to the beginner at a glance a better notion of what to do and what to avoid than pagen of deacription. The anthor is Mr. Max Hesdöbfere, and the pabligher Robrrt Opprnheim, of Berlin. The woik is to be pablished in eight parte, at a low price.

Royal institution.-The following are the lecture arrangementa before Easter: Professor John Gray McKendrick, Profensor of Physiology in the University of Glagow, six lecture (adapted to a javenile auditory), on "Sound, Hearing, and Speech (experimentally illustrated); Professor Charles Stewart, Fullerian Profensor of Payaiology, R.I., eleven lectures on "The External Covering of Plants and Animals: its Structure and Fanctions; The Rev. Philip H. Wickateed, four lectures on "Dante;" Prufeasur H. Marahall Ward, Profeksor of Botany in the University of Cambridge, three lectares on "Some Aspect of Modern Botany The Rev. William Barry, D.D., foar lectares, "Master of Modern Thought-Voltaire, Rousseau, Goethe, and Spinoza;" Prof. C. Habert H. Parry, Professor of Musical History and Composition at the Royal College of Masic, three lectures on "Realimm and Idealism in Masical Art" (with musical illastrations); The Right Hon. Lord Rayleigh, Professor of Natural Philosophy, R.I., six lectures on "Light." The Friday evening meeting" will begin on Janaary 17, when a discourse will be given by the Right Hon. Lord Rayleigh, on "More about Argon;" aucceeding discourses will probsbly be given by Professor Bardon Sanderson, Mr. W. S. Lilly, Dr. John Marray, Mr. J. J. Armistesd, Dr. Edward Frankland, Mr. A. R. Binnie, Mr. Sidney Lee, Profemar T. R. Fraser, Profensor Dewar, and other gentlemen.

Early Wallflowers.-We haverecoived from Mesars. Sutton \& Sons their Earliest of all Wallflower gathered from plants sown as recently as lat May. The planta have already been flowering aince the middle of September, and are still full of bloom and bad, and should the weather not prove too severe, will continue to jield acceptable gatheringa throughout the winter monthe, burating again into new vigour and beauty at the first touch of apring. Tise value of such a pretty spring flower in December mutt be apparent to all, eapecially growers for the market.

Fruit and Market Gardens.-The following is the acreage under mall fruit crops as given in the Agricultural Retarns for 1895, published by the Board of Agriculture:-England, 68,122; Walev, 1,175; Scotland, 5,250. In each case, but especially in England, there is a considerable increase in the area devoted to small fruit cropa an compared with that noted in 1894. The total area of land and water in Great Britsin is 56,771 728 acres, and in Ireland 20706,258 . Kent has 22.272 acres under fruit, a alight increane over 1894. Middlesex continem nearly stationary with 3982 acres; Lancathire has 2517 ecres against 2,396 last year; Surrey 1.468 instead of 1,331; Worcester, 3.144 al compared to 2,508 . The total area used as orchards in 1895 is given at 212,963 acres in place of 208,82I in the preceding year. The largest orchard areas are, in Davonehire, 26955 ; Hereford, 26538 ; Somermetshire, 24520 ; Kent, 23260 ; and Worcester, 19,665 acres. Market gardens occupy in England a total area of 85,398 acres, an increase of more than 4000 acres over the preceding year, Kent has far more market gardens than any other county, the acreage being ratarned at 12.516 acren ; after which comes Middlesex, 9,410; Bedford, with 7,274 acres; Worcester, 5.586; Essex, 4,740 ; Sarrey, with 3,688 . The remsining counties bare all a very much maller area devoted to market gardeniag.

Pierre Notting.-The death of this famone ronarian, of Laxembourg, is annonnced. According to the Revue de l'Horticulture Belge, M. Notring was is hia acventieth year, and died on November \({ }^{2}\)

The Publisher of the "Gardeners" CHRONICLE."-We greatly regret to announce that this Joarnal in no longer to have the aervicen of Mr. A. G. Martin as publisher, consideration of health necessitate his reaidence in the Tranavaal or other dry climate. Mr. Martin leaves with the aympathy and goodwill of all his colleagues, who truat that he may speedily regain hil health and quickly obtain some anitable occupation. Mr. H. A. Stratton, who for many years has been a trusted assistant, will, in future, undertake the dutie of pablisher.
horticultural Progress in Holland.Great activity prevail just now in Holland in the matter of technical education. A chool of Horticulture is eatablished at Wageningen; a laboratory for the atudy of Vegetable Pathology, under the direction of Profearor Ritzema Bos, has been foun led at Amsterdam; a new horticultural joarnal has lately been entablished; and the dibum Van Eeden is to be continued as the Bulbilegium Baarlemense, onder the aunpicer of the Society of Balb Caltivators.

Begonia Froebeli ingomparabilis \(\times\).-The invertion of the following letter from Mr. BenNetT Pö̈, enable as to correct one or two miaappreben sions relating to this fine plant, see p. 680, fig. 112 , Mr. Bennett Poë, it appears, wat not the raieer of the plant, but Mr. Froeber, of Zarich. The fiowern, instead of being only 1 inch in diameter, measure upwards of 3 inchen:-
"The introduction many years ago by Roezl of a tuberous Hegonia from Ecuador, dedicated by Alphonse de Candolle to M. Froebel, of Zurich, was an acquisition to growers of tuberous Begonias. for its blooms, though not large, were very brilliant. Some years later, another tuberous Begonia, winter flowering species, was introduced from Peru, Begonia polypetala, perhaps the mont distinct and remarkable species yet introduced. M. Froebel, of Zurich, emploged these two species in the production of the atately and handsome hybrid figured last week, which having taken in general appearance so markedly after the seed-bearing parent, was sent out under the name of Begonia Froebeli incomparabilia \(x\). But happily, in the time of flowering, it takes after the pollen parent, and produces its brilliant blooms in the winter months, whea they are far more valuable and appreciatod. I have, grown this Begonia since 1880, the year it was nent out, and have advoested its claims in the gardening papers both then and sabsf quently, and again as recently as this autumn, for it has sabs quently, and again as recently as this autumn, for it has
never failed to be a remarkable plant each winter. It would oem to be quite unknown, from the fact that it came as a surprise to those present at the meeting of the Royal Horticulcural Society on November 23 . I have frequently wished I could show it, but until recently my garden was too far distant to evable me to do so, as Begonias are not plants that will besr a jurney of 450 miles before being placed on the exhibition table. A word as to its culture, which is of the essiest. The tubers are potted about August, when they will mo longer remain dormant, and are placerl in an ordinary span-roof greenhause where Nerines and varions other plants flower, and there they have been in blossom since early in October, and will continue some time longer, judging by the sscession of flower-stems to follow. J. T. Bennetr-P.

A New Phabe in horticulture.- a corrempondent of the Times calls attention to what he calle a "totally new departare." Naturally curious to know what this could be, we read on to fiad that the new departure consisted in retarding instead of forcing certain plante. Nuthing very new in this, urely. The application of the practice on a large cale to the Lily of the Valley has reaulted in an average of 95 per cent. of flowera from the end of antuma up to Christmas, instead of 50 per cent. obtained by forcing.

The Thames Embankment. -The "layingout" of the enclosare, east of Charing Cross Station, has been unatiafactory from the firat. The recent erection of the band-atand made thinge worte-the dotting of some miserable Eaoaymus on the green lawns seemed to ahow how little the planter valued the effect of space and "repose" afforded by the turf; and now, quite recently, some flower-beds of the moat extraordinary and meaningless pattern have been carved out. There is plenty of time to alter thene, and perhap something may yet be done to improve the general disponition of the lawns, and render them appropriate to the outlines of the enclosure.
"A History of Gardenina in Enaland."
The Hor. Acicta Amemers's wonk under this title
has been published by Mr. Quabitce, of Piccadilly \({ }^{\circ}\) This is not a book to be dismissed with a mere mention. It is a atandard book, likely to become classic. We hope shortly to give a notice of the book at greater length than we are now able to do.

Stock-takina: November.-Once again the trade and navigation returns bring au pleanant new. The importe and exports for the pat month of November are greatly in excens of thone for the corresponding month in 1894, and the eleven montb:' totala are aluo a cheerful contrast to the figure set down for comparison in lant year's record. The excen of importe for the past month is \(£ 3.737,012\); for the eleven month juat finished the increase is \(£ 4320,557\), as compared with latt year's record. The uanal extract from the monthly ammary is as follow:-
\begin{tabular}{|c|c|c|c|}
\hline Imports. & 1894. & 1885. & Difference. \\
\hline Total value of imports & \[
\underset{35,234,149}{\stackrel{\swarrow}{2}}
\] & \[
\underset{38,971,161}{\mathscr{L}}
\] & \[
\begin{gathered}
\mathbf{\boldsymbol { L }} \\
+3,737,012
\end{gathered}
\] \\
\hline \[
\begin{aligned}
& \text { (A.) Articless of food } \\
& \text { and drink - duty } \\
& \text { free ... }
\end{aligned}
\] & 11,539,298 & 12,858,182 & +1,188,884 \\
\hline (B.) Articles of food and drink-dutiable & 2,499,005 & 2,602,113 & +102,508 \\
\hline \[
\begin{array}{cc}
\text { Riw materials } & \text { for } \\
\text { textile } & \text { manufac- } \\
\text { tures ... } & \text {... }
\end{array}
\] & 6,835,64 & 7,700,372 & +864 728 \\
\hline Raw materials for sundry industries and manufactures ... & 3,683,793 & 4,103.954 & +40,159 \\
\hline (A.) Miscellaneous
articles
... & 1,489,780 & 1,485,178 & -4601 \\
\hline (B) Parcel Post & 88,420 & 83.461 & +17.041 \\
\hline
\end{tabular}

It in worth noting that, with the trifing fall of \(£ 4,604\) under the heading of "Miscellaneous," the increase extend to every section into which the returns are divided-what is "minus" in fruits and vegetables being made up in other sub-mections of the daty-free articles of food. It is long since such a atate of thinge was placed to the credit of imports. A second great acheme of road construction will shortly be carried out in Earopean Rasia, nnder the apecial aperviaion of the Department of Road and Bridgen-to connect producer and exporter.

We fancy that Parish Councila could be made of immense use in bringing mall growerf, as well as otheri, into complete touch with all consuming centres. It is fair to note here that the Board of Trade officials appear to be in earneat reapecting help in the matter of light railway-the President of that department, together with an engineer of repate, having been on the Continent atudying the system preparatory to setting to work on existing materials and Parliamentary action. As to our unual extracts on the imported fruite, rooti, and vegetablet, we give the following:-
\begin{tabular}{|c|c|c|c|}
\hline Importa. & 1894. & 1895. & Difference. \\
\hline its, raw :- & & & \\
\hline Apples ..0. ...bush. & 1,178,585 & 589.724 & -549,871 \\
\hline Cherries ... ... , & ** & \(\ldots\) & ... \\
\hline Plums & 1,533 & 330 & \(-1,218\) \\
\hline Pears & 59.331 & 22.458 & \(-36,875\) \\
\hline Grapes ... ... & 100,691 & 138,888 & +87.974 \\
\hline Unenumerated & 58,768 & 45,933 & -12,805 \\
\hline Onions & 507,601 & 609,888 & +11,787 \\
\hline Fotatou ..es ... owt & 151,05 & 83,181 & -88,834 \\
\hline Vegetables, raw, unenumerated ... ... value & \[
\underset{68,531}{\mathbb{E}}
\] & \[
{ }_{71,653}^{a}
\] & \[
+\frac{\mathscr{L}, 105}{}
\] \\
\hline
\end{tabular}

It will readily be observed that "minus" has it-or, rather the Britich prodacer. It would be pleasant to record some new industry in connection with Apple production; pouibly that will come in time. The disponal of this fruit in Brittany seem: beyond the powern of railway companies; there Apple-waggons line the roads to the railway atation, often weeking in vain for carriage, sometimen waiting for a day or two until the goods' entrance opent to them. The wonder is expressed at to whether there will be any reduction in the price of cider in the cider-conoming diatrict of Fravep. There doen
not appear to be any boycotting of that indastry on the other side of the Chenvel, an reported for this country by jour correspondent, "E. \(\mathrm{C}_{0}\)," in a recent number of the Gardeners' Chronicle. And now an to our-

\section*{Exports.}

These foot up for last month the handsome total of \(£ 19540333\), or an ircrease of \(£ 1457246\) over the total for November lat jear. Tbere are decrease in the value of live aximale, in raw material, and machinery; but the total is not very great. The increase in the eleven month just now ended in putat \(£ 8,295,982\). With a good earplas in the Exchequer, and a eettlement on the Arcerican money quention, we can afford to look ahead with confidence. Notwithatanding the import-duty of 78 . per ton on coals entering Rusian posts, it would neem that the demand for Ruanian coal has not been increased, or the consumption of the Euglisharticie reduced. By-and-by, when the promisedroadare made there may be a reduction in the cont of the native article. In conclasion, it may be poted that complainte continue to be ent in by our Conala as to the picking up of some of our trade by "the foreigner," who is keen to note exactly what is wanted in foreign countries, and send it out. We require an extension of our ejetrm of technical achools; we have done pretty well, but very much more is required; and it is about time that the ovce much-talked-of Imperial Institute hould give more reaton then it now does for it exinteace.

Dundee Chrysanthemum Society. - The annual meeting of the Dandee Chrymathemum Society wat held on the 5th inst., Mr. D. Storris in the chair. The Secretary (Mr, W. P. Laird) in bis report referred to the question of obtaining a Corporation Cap for competition at the annaal exhibition of the Society, and aid though the request which had been made to the Council had been refused, he had hopes that they would yet have a Corporation Cap. The Treasurer (Mr. D. Croll) reported that the expenditure for the jear wat \(£ 6695\)., and that there wan a debit balance of \(£ 610 \mathrm{~s}, 8 \mathrm{~d}\). They had, however, £27 4s. 1d. ntill at their credit. The deficiency, he explained, was accounted for by the state of the weather at the annual ahow, which brought about a reduction in the admisaion money. The reports were then adopted, and cffice-bearer for ensuing year elected.

Cheghunt, Wormley, and District horticultural Mutual Improvement Society.The unual fortnightly meeting of this society way held on Thurnday, Dec. 5 , at Turnford, upwards of a hundred members being present, H. N. Busirex, Eaq., preaiding. The secretary, Mr. W. L. Yates, having read the minates of the previous meeting, Mr. William Harbison, of the Tufnford Hall Nutseries, delivered an inatructive lecture on "Grape Growing for Market," dealing exhautively with the sabject, including the early history, introduction of the Vine to this country from Avia Minor; propaga. tion, grafting, planting, manuring, fertiluation of the flowert, and the entire rontine of cultivation under glase of all the more popular varietien of Grapes. The method of packing for rail and Covent Garden market were fully dencribed and illantrated. At the close a dircunion was initiated. On the motion of Mr. W. H. Miles, afconded by Mr. Rolfes, a hearty vote of thank way accorded Mr. Haressoz for hia lecture. The next meeting will be held on Dec. 19, when Mr. W. Caslea will contribute a paper entitled "Bee-keeping, and ite relations to Horticulture"
the People's Palace horticultural SOCIETY. - A meeting of the Commiltee took piace at the People' Palace on the 7 th inst., Mr. E. Sitea in the chair. A very encouraging report wat received from the judges who made the award to the greenhouses in October last, they having mado an inapection of nearly forty in the East Ead, and they reported that the housen, although moetly of howe construction, were clean, and the condition of the plants generally iatiofactory. The Curynuthemum how held on Oct. Sl and two following day?,
atirely consisted of plante and cut flowers shown by members; and the excellent quality seen in many of the plante and blooms was very gratifyling. It was resolved that three exbibitions be held in 1896-a spring show on March 26,27 , and 28 ; a aummer show on June 25 and two following days; and the Chryanthemum show at the end of October, or during the second week in November, a date to be fixed later on. A series of monthly lectares of an elementary cbaracter has been arranged, and a montbly meeting of members also, at which they will be invited to contribute plante, \&c. It was also reported that the spring and atamn shows had proved financially anccesaful, but there was a small lose on the aummer show, owing to the stormy character of the weather daring the time it was open. It is also in contemplation to attempt some modification of the thickly populated arpas known at congested diatrictr, thoagh great difficalty is experienced in accurately defning the asme. It may be atated that the rociety supplies its members with bulb, seeds, \&c., at cost price, and to the moat needy cuttings are supplied free of cost as far as they can be obtained. The subucription of the members is quite mall, but donations from varions ladies and gentlemen greatly asnist the committee in their work. A cordial vote of thanks was given to Mr. Sara for presiding.

On Saturday evening lant Mr. J. W. Sanders, the editor of Amateur Gardening, gave a popular and interesting lectare on "How Plants Grow," before a very large audience of members and friends of the People's Palace Horticultaral Society, Mr. Riceard Deas, the horticaltaral adviser of the society, presiding. The lecture, which was purely extempore, and delivered in an eacy, converrational atyle, wat illuotrated by a number of diagramp. The greateat interest was shown in the sut ject, and at the close of Mr. Sandins' addrest, many queations were pat to him, and an enthusiantic vote of thanke was accorded to hifo. The next lecture will be by Mr. Richard Dran, on "Dried Flowers for Chriatmas Decoration."
"The Autocar."-This is a new journal, published by Iliffs \& Son, Coventry, and 3, St, Bride Street, Ladgate Circue, E.C., in the intereate of the mechanically - propelled road-carriage. In thene pagen the superiority of automatic carriagen to thone moved by horse-power is warmly arged. There are illustrations ahowing various aelf-propelled vehicles, and whether or not these are ever largely used in our atreets, they are at least appropriate in certain instances. The Autocar does not deal with any special make of vehicle, bat with all driven by machinery, whether carriage, waggon, tram, or bicycle, and whether the motive-power be afforded by ateam, electricity, hot-air, or petroleum.

Aubtralian Fungi.- From the Department of Agriculture, Victoria, comes a aytematic arrangement of Australian fangi, by Mr. D. McAlping. The volume consiatu of aseries of tables, containing condensed information, nsmen, authorities, habitats and characteristics of the several species, which should prove most aseful both on account of the importance of the uabject treated of, and the clearnees with which the information concerning it is here given. The author inclades in his treatios a "host" index, and a list of work apon the aubject.

Apples in Paris.-The glat of Applen from Normandy is so great that prices have fallen to a very low figare. It is many jears aince the crop of Apples in the province hat been so large, and the cultivatore are at a lose what to do with this auperabuadance. Some of it might be made into cider, but not every variety is fit for that purpose.

\footnotetext{
Moss Litter ano Peat Industrieb, Ltd. A company (headquarters, 32, Qaeen Victoria Strest, R C.) has been atarted which bears the above title, and hat for object the introduction of fabric: made from mone litter and peate It has been diecovered that from theme materiale not only \& valuable sborbent antiseptie wool for argical drewinge can be made, but also textilee of various grades, ranging
}
from coarse blankets to the fineat cloth. Another property posseased by peat is that, when ubmitted to certain preparatory processes, it becomes hard as iron, and takes a good polish. Uader yet other treatment it can be developed into tough white paper. These several valuable uses for a raw material hitherto comparatively neglected, have already met with conaiderable appreciation, and optimiste hope that (largely through the intervention of this company) Ireland may in the immediate futare reap aubatantial benefit from her atores of yet unworked treanare.

Eucharib arandiflora (syn. E. amazonica). -Mr. Osman eende usfrom Brentry Gardens, Weat-bary-on-Trym, a fine photograph of this plant, which shows how well the plant is grown in that eatablishment. The photograph shows twenty plante beariog about 1000 flowers-the third crop this year, Had we not already figured fine specimen of this plant, we should have been tempted to reproduce the illustration with which \(\mathrm{Mr}_{\text {。 Osman }}\) has kindly faraished us.

FIG. 119.-
geed bearivg ghoot of cepeliotaxus pedumculata SEEDS BERRY-LIKE, OLIVE-COLOURED. (SEE P. 717.)

The Yorkshire College, Leeds - The Department of Agricultare of this College, which is affiliated to the Victoria Univeraity, has pablished ite fourth annaal report, which is of a most aatisfactory character. In addition to the two yeara' training, the College providen for special lectarea in the country districta on horticultaral and agricaltaral suljocts, the attendance being, generally spesking, good; in nome cases the average attendance was as many as 350. Some of the villagersa minority we are glad to see-" refused to try to learn anything.'

Technical Horticultural ingtruction.That excellent gardener, Mr. J. Crook, of Forde Abbey Gardens, Chard, occasionally places his aervices at the disposal of the Somerset County Council, and has just recently completed a course of garden lecturer at Crewkerne. His ayllabus neems to have been a comprehensive one, as it includes two lectares on frait culture, dealing with hardy trees, anch an Apples, Pears, Plumu, \&cc., and also with bush and groand fruits. Two lectures were devoted to vege-
table culture, including the most prominent cropi, one to the preparation of the soil, manuring it, \&c., and one to flowers and their calture. Such a course as this may well be given in many localities, for there is ample room for wider instruction in even elementary gardening.

Scottiah Horticultural Aesociation, Eoinburah.-Oase of the largeat meetings of the above society gathered at their rooms, Sbo Andrew Square, on Tuesday evening, the 3ed inst., when Mr. Mazcola Dons read a paper on "Gardeners and their Employers," as given before the Royal Horticaltaral Society. The paper wat well recaived by the membera, and a diacasaion generally agreeing with the pointe laid down by the writer followed. After the reading of thin paper, the treasarer, Mr. Alex. Macerenzie, atated that although the anfortunate weather might have been expected to reduce the financial success of the last Chrysanthemam Show, the balance in hand proved to be considerably over £100. Mr. D. Murbat, the president, occupied the chair, and a motion of giving the usual ubscription of \(£ 5\) each to the Gardenera' Orphan Fand, and to Edinburgh Infirmary, was received with general satiafaction.

Victorian Fruits.-It is not very much that our friends in the colony of Victoria can send us, but what they forward is picked and sent on in as good a condition as that ment by most other sender -the quality being of a high order. It is, therefore, satiafactory to be able to atate, on the most trustworth authority, that, the account being made up, a fairly remanerative profit has been found to reault from the ventare. This is the more atiafactory because continued effurt after improvement will most asuredly follow, which bat a few years hence will be pleasingly illustrated in our principal markets.

Fruit-growing in Britibh Colombia. There is not nearly enough trait-trees grown in the State to meet the home demand, and most of the trees plated were imported from Oregon and Washington, or from the Eatern States and Oatario. This is not because good nursery atock cannot be prodaced; on the contrary, as fine treen can be grown there as in any part of the world. Peara are not so satiafactory as other hardy fruit treen. Here there is an opening for gardenera, mall or large capitalists, and others in need of an outlet for their money, experience, and energy.

Prospects in Natal. - The completion of the Transvaal-Natal Railway has undonbtedly opened up a fair prospect for those connected with the land and itm products in Natal. The railway runs from Darban through the Transvaal, and it is believed that all vegetablem and fruit grown in the Britiah colony will find a ready wale in the land of gold and diamonds. The Government Agent in London informed us the other day that a Natal farmer's agency is on foot, to which farmer can aubmit their produce with the knowledge that a sale will be effected in a business-like manner, and with the certainty of prompt payment." He also atated that the fibre induatry is receiving attention in Natal. Arrangemente are being mado that some 500 acres ahall be planted with Agave in the lower Umzimkala diatrict. All this look as if the colony was waking up, and juat at the right time.

Hooken's "ICONE8 Plantarum." - This publication, though everely botanical, frequently contains references to plante which are probably dentined in the fature to become of horticultural importance. The latt isnued part (vol. v., part 1, November, 1894), contain figure and descriptions of everal new Dipterocarpa, by Sir Dietrice Brandis. Petroconmea grandiflora, Hemaley, a Wentern Chinese Gesnerad, is a charming little tufted plant with much of the habit and appearance of Saintpaulia ionantha, but the leafatalke are longer than the blade, not to apeak of other characterf. The flowers are dencribed as cobalt blue. It should be looked after by our collectore when they have
time to look after nomething besiden Orchidn. Dr. STAPF dencriber several new Melastomadr, some of which mat be worthy of introduction. Mr. Baker dercribes and figures ( 0.2423 ) a curious little Aloe from Natal with linear apotted leaven, margined with mall whitish pines.

New Garden Plants of the Year 1894. -As an appendix to the Kew Bulletin has been publiohed, an alphabatical liat of plante newly-introduced into British garden:, compiled from the meval horticultural journaln of Earope, and from nome of the nurserymen's cataloguen.

\section*{CEPHALOTAXUS DRUPACEA.}

We are glad to have the opportanity of figuring the frait or rather berry-like needs of Cephalotaxus drupaces kindly forwarded to us by Mr. D. Crombie, from the garden of Lord Powericourt. The eeeds at here figared, taper at each end, and towards the base are narrowed into a neck-like proces unlike anything we have yet meen in the genus. An to the plant itself we may recall what was said in these pages on January 26, 1884, p. 113.
"C. drupacea (fig. 120), in Britiah gardens is the dwarfent form, forming a low banh with greeniahyellow ahoota and leaven, The latter are very gene-
rally apturned, and thin not only when the flowtre are being produced, bat alto on the sterile branches, so that the two row of leaves tha form a trough along the apper aide of the branches. The individual leaver do not greatly exceed 1 inch in length, and are about \(\frac{1}{6}\) inch in width, alment perfectly linear and straight-nided, sarely falcate, abruptly pointed at the tip, rounded at the bave, with a very short petiole. The male catkina are ataked, each atalk immediately after it origin in the axil of the leaf being abruptly bent down. warde out of the way of the leaves. The atalk of the male catkin is about is inch long, about the aame length as the minate globose catkine themmelver, and covered with overlapping ovate acate bracta which pass into the acale of the catkin. The acales of the terminal leaf-bud of the whoot are almont all distinctly acaminate. The reed-bearing pedancles in the native apecimen are approximate, and the lerry-like zeed itself ovoid. We have a rough thetch of the aeed of this plant, derived probably from the garden of the late Sir Frederick Pollock, at Houdalow. It is ovoid, and rather pointed at both ends, amaller than in pedunculata proper (tee fig. 119). In Japan, where it is often cultivated, it is anid to form a opreading tree of mall atature. No Chinese apeciment are in the Kew Herbarinm; bat Mesart. Veitch in their Manual, mention it at having been discovered in North China by Mr. Fortane in 1849, althoogh Fortane doen not mention it in his commanications on the sabject in this journal, and we suapect his plant may have been the true C . pedunculata."

Van Tieghem (Bull. Scc. Bot. France, 1891, A pril 24, p. 184), point out a character which is peculiar to this genus, and that is the existence of a resin-canal in the centre of the pith. This character is so easily observed that it is ueful to the gardener, who can thut without aceing flowert or fruit, immediately ascertain whether he has a Cephalotaxus to do with by cutting a amall portion of a branch and observing whether there is a resin-canal in the centre. Oa a croas-cat the canal, of course, presents the appearance of a blackish dot in the centre of the pith.

\section*{Notices of Books.}
ingects and Ingecticides. By Clarence Weed, D.Sc. (Kegan Paul, Trench, Trü jner, \& Co.).

Tris is a second edition of a book that has already received favourable notice in these columne. It is written by an American profemsor, bat much of it in applicable to the old coantry. Here, however, we are exceedingly slow to adopt the method recommended by experta; perhap because it in feared that the trouble and cont would be excenive as compared with the value of the realts. Bat how can we know this without experiment? Whilat the Uaited; States, and oven Earopean countries, can counti, experiment atationes by the acore or by the huadred, we in thin country ahould have a difficulty in employing the finger of two hand in computing the number of similar inatitutions, nor have we a single State entomologiat.

Aariculture: Practical and Scientific. By James Muir. (Macmillan \& Co.).
This in an introdnction to the atudy of the principles of agriculture, and gives much nerviceable inforsation a to the application of thene principle to practice. We find many details given an to the natare and ave of manure and eewage, which the reader has unally to dixinter from volaminous trestiver. Manures as at present used are employed wastefully, because they are "sown" or dug in at atated times by the calendar, rather than in accordance with the need. of the plant at different periode of ite growth, and in relation to the local and semonal conditions. Daring the greater part of it exiatence, water forms the bett manure (if we may 0 call it) for plants. The atimulant and natritive abatance which conatitute manures are only required in relatively amall amounte, and at particular atages of growth only.

Gardenere, in their management of planta under glase, anderatand this better than agriculturista do, but it ill, of courie, an eatier matter for the gardener than for the farmer to regulate the amount and to time the applic stion of manare; bat making all due allowance, the farmer might learn a good deal from hi brother in the garden.

The Potato in field and Garden. By W. J. Malden. (London: W. A. May, Mark Lane Express Office, 150, Strand.)
"The introdecion of better varieties of Potatos, the adoption of more economical methode of dealing with the crop, the discovery of mean for keping in check diveases of plante, have made Potato growing an art which can only be auccessfully carried out where the farmer or gardener is abreast of the timen vith segard to information on all these pointe, as kome and foreign competition are very atrong. The want of a more perfect knowledge in individual casea cause a very large portion of the crop to be grown uoprofitably. Toose who thoroughly anderstand the subject, and cater for the best marketn, fiad it a profisable basiness, although they may not be otherwise better aituated than their leas auccesaful neigbbours." With the sentences \(j\) ant quoted this little book opens. They at once attract our ajmpathy, and we turn to the ancceeding pages to see to what extent the author act up to his own standard. The inveatigation is so ratiafactory that wa may clas this as one of the beat booke on the undjet, and in some pointe the information it containe in more varied and more "abreast of the times" than in any work of mimilar character that we can recall. The work ander notice is divided into ten section, the first of which deale with the crop generally, incladiag its introduction into Firope, new varietiez, \&c. O.her nection: deal With soils, planting, manuring, seed varietien, treatment during growth, disesses of the crop, digging Putatos, and the cost and feeding value of the crop.
We are diepused to think our author under-eatimates the \(\begin{aligned} & \text { iut of high-m solding, as recommended }\end{aligned}\) by Junen for the mitigation of the effect of the Putato diefanp. We have ns experience of this as practised on a large ecale, but for amall gardens and for cottagera we should recommend the sytum an preferable to the une of the Bordeaux Mixtare. Is in mach mora manageable, cheaper, and equally, if not more, ffisient. Another adranlage it has in that where this plan is practised, the rowa are not placed no near together as naal, nor are the plants in the rows so clone. \(O\) \& course, a cood deal depends on the habit and mode of groxth of the variety, but in any case the greater the apace between plant and plant, the lean is the risk of infection.

Handzook of West American Cone Bearerb.
Mr. J G. Lemmon, who hat had euch excellent opportunitie for atudying the Californian Conifers in their native baunts, and whose zaal and enthusibum hive enabled him to turn them to auch good accoant, has pabliahed a pocket edition of his deacriptive notes on the Conifers of north-went America. It is an excellent little book, illustrated by mall photographe. If is written more especially for those who are not botaniats, and en attempt is made to introduce good English names in place of Latin deaignations. We sympathice with Mr, \(\mathrm{L}_{2}\) mmon' avpirstion, but we cannot congratulate him on the auccess of his attempts. To us it appears that much names es "Evergreen favciculars," "Broken cone Lamber Pinen," "Pendent Fraited Pendenten," "False Hemlock Spruces," "Erect-fruited Solitares," are no improvement on the more terse Latin epithets. People who are really interested in botany soon casee to find the language an impediment; it is not worth the trouble to coin new words for those who care for nothing save externals, oo far as plants are concerned. The present little book may bo had from the author, Tolegraph Avenue, North Oakland, California.

Irrigation Fabmina: A handbook for the practical application of water in the production of crops. By Late Wilcox; 95 illastrations, 312 pages. (Now York: K•gan Paul, Trench \& Trübner.)
The author of this work is a practical man, who has opent the greater portion of his life in irrigation work, and is a recognised authority in the United States on the whole abjact of irrigation from a practical atandpoint. The new manual containa twenty chapters and ninety-five illustration. This book is primarily written for and adapted for western farmers and farms, but is equally valuable to farmers in the south and other sections of the Uaited States, and other countries. It ia divided into twenty chapterm, each of which is a condensed treatise on ite apecial topic. The concluding portions of the book give a review of the common law of irrigation, and a glosary of irrigation terma. The other chapters are devoted to the consideration of the following topics: Advantages of irrigation, relation of coils to irrigation, treatment of alkali, water apply, canal conatruction, reaervoirs and ponde, pipes for irrigation parposes, flames and their atructure, duty and meamarement of water, methods of applying water, irrigation of the garden, irrigation for the orchard, the vineyard and amall fruite, alfalfa, windmills and pumpn, devices, appliancen and contrivances, ab-irrigation and sub-soiling.
The book is, as we have aaid, apecially adapted for certain portion of the United States, bat it will be very serviceable in many of our coloniea and in India, on which account we recommend it to the notice of our colonial reader. The practical detaila of construction, \&c., will be found very aerviceable.
Fur greenhouses a plan is adopted of having raised beds in which rown of 21 -inch drain tiles are placed at about 18 inches apart, and at a slight alope, so an to ensure a anffisient fall and obviate atagnation. The lower ende of the pipes prij ct beyond the bed, so that they can be closed during the time that the water is being poured into the pipes at the other end, and opened a'ter a time to allow of the pansage of the arp'us water. This plan also almite of the aëration of the moil. Whether the pipes would not aoon get blocked with roots is a matter to be determined, bat if they did, the evil could be remadied without much inconvenience.

Analytical Key to the Naturil O dera of Flowering Plants. By Franz Thonner. (S wan, Sonnenschein \& Co.)
A series of tables intended to facilitate the detection of the neveral natural orders of plants by the atulent. To us they seem more likely to be useful as fornishing hints to an expert. For instance, it in very misleading to a beginner to city at the characters of Pasiflorez (ree p. 113), "Stamen 10 ; ovalea parietal. Shrubs or trees. Juice milky. Calgx 5 lobed. Corolla-lobes valvate, rarely contorted in sestivation.' The beat way for a stadent is to frame auch table for bimaelf.

\section*{THE HIPPEASTRUM.}

These are now dormant, and at auch time ordinary cultivators are apt to be forgetful of them. Hippeastrums ahould gradaally pase into the reating period in September; and again attention is needed that they be not dried off too rapidly, or air and light admitted too freely. Even daring growth the Hippeatrum must have a light shading from bright anahine, and a moderately high temperature of \(65^{\circ}\) to \(70^{\circ}\) a a minimum, and a rather moist atmosphere. Jut an the temperature is gradually increaned when atarting the plants, to alao mat it be gradually decreased to reat them. The water may be withheld altogether as woon as the leaven take yellowish tinge.

At present the plante are quite dry at the roots, and they have been removed from the tan, where the roote had ramified all through the planging material. We have carefully examined every bulb to remove
the dried outer coating, with any innect pents that may be hidden amongat them; and an a further precaution, the crowns are dusted with tobaceopowder. Thiskills thrips and the mealy-bug, if any are preant. Air ahould be admitted freely by day, and the heating apparatus must be used to dry up damp, which may be idjarious to them. N, time thould be lost in getting the potting-soil ready. I like to have such soil mixed at leat six weeks before using it, so that the manure may in some degree be absorbed by the loam; and good compost may conaist of about two parts of good jellow loam to one part light fibrous peat, and one part of decayed atable-manure.

The potting of the plants ahould take place toward the end of January. The bed where they are to be plunged should have been previously prepared by mixing some freah tan with the old nuterial, and at the time of potting the bulbs it may be \(85^{\circ}\) to \(90^{\circ}\). Piange the pots to the rimm, as they are potted. \(R\) :potting must be done carefally, ind over-potting avoided. The largest bulb are about 6 inches in diameter, and these are potted in 24's or 8 -inch pots.
Good flowering balbe may be pat in pots \(4 \frac{1}{2}\) to 5 inche diameter. Toe pots mould be wathed and well drained. Ia preparing the balbs for potting, all the old material mast be removed, and the base of the bulbs examined. The roots grow in a circle round the base of the bulba, leaving the centre of them quite bare, and there is unaally a fi \(m\) of dried skin covering this. Remove the skin to see if there is any decay underneath, and if any be present, cat it away and dust the wound with quicklime, presing it in with the fingers. The bulbe ahould be placed on a cone of mould, with the roote hanging down the sides; preas the soil firmly amongat them, finithing off with the bulbs about half covered. SJmesand ought to be mixed with the compost, and a little ought aleo to be aprinkled on the sarface of the soil. \(J\) Douglas.
Nursery Notes.

WILL TAYLER'S, IIAMPTON, MIDDLESEX.
Is the varied outaide department of nursery work and experience, none is m re replete with interenting details and information than the ruittree department, where this is a pecialty. Vaited late in the autumn, aay till the end of the month of Oitober, much information maj reacily be gleaned that cannot fail to be of use to thone c)ntemplating finit-tree planting. Amatears eapecially leara moc \(a\) in thim way, that it is almost imposaible otherwise to obtain. In any fruit-tree nursery worthy the name thare are to be fuand obj ct-leasons by the sco e. The trees may be seen in all shapes and methods of training, and comparisons can be made of their behaviour on diff rent kinds of atock. Moreover, if the viait be early enougb, the cropping capabilitie of the various varietiea may be observed, a rather important piece of information for the beginner; while those who are past the elementary atage will fiad much to intereat and enlighten. Tae past season I had the opportunity of looking through the fruit-tree nursery of Mr. Will Taylor, which is nitasted in what is locally known as the "Broad Lanes," Hampton, and for the cultivation of fruit trees and \(R\) ses occupie a very favourable positiod. It is known an the O,borne Narsery, and was some yeara ago a brancis naraery of the late firm of Osborne \& Sons, Falham. Mr. Tayler has now beea eatablished here for the last twelve years or so, during which tims fruit trees and Roses have absorbed much of hit attention. Hie frequent contribatione of fruit at the leading exhibitions are well known, and among these the autumnal show at the Crystal Palacs is a notable instance. I; is a feature of the nuraery that many of the fruita attain to excoptional niz 3 , weight, and colour. As proof of this, some dishes of Blenham Orange Pippin Apple were eagerly purchased by a leading fruiterer for the extraordinary price of 18. a-piece, and this, too, in an abundant year. At
the tame exhibition, a crowning fruit of a dish of Pesugood Nonuch weighed exactly 22 oz . When gathered, while a similar fruit of Jubilee turned the icale at 17 (z. Admittiog that the jear has been favoorable for froit crops, one cannot help bat notice in this nursery exceptional instances of fine coloring, unch varieties as Bismarck, Fearn's Pıppin, Gascoigne's Scarlet, Alexandra, Annie Elizabeth, and Crimon Queening being eapecially worthy of note on this account. The last named Apple is deep crimson in colour, and, as here seen, with the frait coloured all over, is very handsome. Indeed, such varietiea are valanble in the garden from an ornamental atandpoint when they have anch exceptionally high tints. An instance, quite the reverse, was to be seen this season in that over-praised American Apple, Newtown Pippin, which cannot begrown an atiafactorily, as can the varieties named in the open quarters. It is said to require a wall to grow it to perfection-by no means a recommendstion for it, when one rees it side by side with the brilliant Bienheim Orange Pippins grown in Mr. Tayler's nursery. Reinette du Canada is highly apoken of, and the fruits fully endorse the high encominms passed upon it. It is perhaps the largest deasert Apple, and valuable also as a late kitchen fruit ; the latter are covered with ruset-brown akin, has tender gellow fleth, of fine flavour, and is is withal a heavy cropper. Ringer is aloo a heavy cropper, and relisble; it is regarded as a mid-season frit, and is good till Chriatmas; the flesh in aweet, requiring little or no sugar when cooked.
Space, however, will not permit of a lengthy enumeration of varieties, soffice to say that all the leading kinds are represented in good fraitful trees. Particularly noteworthy is the small size of the trees that have borne the brilliant-coloured and large fraite alluded to of Biamarck, Bienbeim Orange, Peargood's Nonauch, and others ; and this, with the ordinary caltural routine in such narseries. For example, trees of Biomarck not yet three jears old, snd only about 3 or 4 feet high, were literally loaded with large and bandsome fruits. And of many other
varieties this is equally true. To amateurs with only varieties this is equally true. To amateurs with only
a. mall area, these buah treer, fruitful in the year of planting, and occapying such little room, are great acquinitions, bying readily pruned, aprayed, and the fruit gathered or examined.
Even market growers are planting the Apple in buoh-for \(m\), ss the fruits from them nbtain the highest quality and fetch high prices. \(Q\) antities of Wellington, Damelow's Szedling, and Sichoolmaster (acid lieab, fine quality, and late), Coz's Ofange Pippin, as well as the carly well-known kitchen varieties, are bere in plenty, and represented by trees in the finent health, vigour, and fruitfulness. The soil throughout the nursery is light loam overlying gravel, is well drained and warm. Pears on the Quince are largely groxn in all the leading varieties, and with rqually satiofactory results. Rosea of all sectiona are cultivated, and the plants for size and general goodness are all that conld be desired. B 1 sh fruits of all kiad in variets, trained trees in abundance, Fige, G ape-vines, and the like, are all grown to mett the constantly-increasing demand, and are alike notewortby for their clean well-matured growth and general appearance. J.

\section*{Home Correspondenoe.}

The apple thee in shrubberies. - at p. 620, a correspondent "D. L. M." inquires, "Why Ahonld not the strongest and bardiest of our Apples be planted in the abrubbery, for nothing looks better in the spring, or coald be more usefal in the autaron." Your correspondent may be interented in learning that this has been carried out in Mrs. Fiszwygram's garden at Lartfield, Hampton Hill, the idea orizinating with Mr. Maurice Map, the pardener, whose argument for doing so war, that if the beanty of the Apl le blossom war realised in a shrabbery, we should not rent antil all shrubberies were freely planted with the trees. Bat becanue Appla treeu abound in our gardens, we are content that the ahrabbery ahould remain crammed
fall of Larrels, with hangry Poplars overhead, and With other abbject equally ornamental or useful. I believe, in this instance, that some little argument was neceasary at first. As soon as the reault was apparent, viz, the increaned beaty and utility combined, Mre. Fitz fygram gladly gave her parmission to plant more of them, and as other trees become too large in the hrubbery they are taken out, and Apple trees planted instead. In many gardens where space is limited, it is acarcely poscible to make the most of the kitchen garden if Apple trees are planted thickly; but by atilising the ahrubberies and the margin of the lawn for the frait trees, a mixed kind of garden is created that is by no means unpleasing, which proves advantageous to the owner and helpfal to the gardener. Of course, a shrubbery ahould not be all Apple treen, any more than as now so generally a confuned mana of various species of Laurel and dingy and rasty Conifers. What is asdly needed is, that a much larger percentage of beautifal decidnons flowering trees and shrabs shoald enter into the crmposition of the shrabbery than is the case at present. J. 「With which opinion we cordially agree. Ed.]
national chrysanthemum society.-What is rally wanted is some information aboat "the auitable hall in a central apot," available for the exhibitions of the above Society. I am able to ary that two years ago a special sub-committee was appointed to visit suitable places within a radius of a mile of the Weatminater Aquarium, and fonad nothing that would afford half the apace for ataging and locomotion as that afforded on the floor of the Aquariam building; while the rent asked for such places as the Q reen's Hall is something almost fabuloue. Complaints of the unsaitability of the Aquariam appear as regalarly every year as does the shortest day, but no alternative sites are saggested. I am nure, from what I know of the committee, they will readily consider any proposal of a practical and nitable nature, if placed before them. OLe fact is perhaps overlooked by "Mum," and otherf. A big Carysanthemum show in November is now associated with the Royal Ayuariam, jast as the Cattle Show is with the Agricaltural Hall, and is annually looked for as a London afisture. Should the National Caryannthemum Suciety leave the Aquarinm, it would not follow that the November show there would be discontinued; the managers of the bailding are keen bainean men, and know the palue of auch an exbibition, and would, no doubt, hold one, and they woald do it on a acale that would dwarf out of all proportion anything the National Cbrysan hemum S ciety would do elsowhere, apart from the subsidy from the Aquarium Company. This is an aspect of the question that I bave no doubt is duly conaidered by the committee, but it is probably one which has not strack "Mam," and thoes who aympathise with him. One thing is quite certain-that, jadging from the report made at the annual dinner, anociation with the \(R\) yal Aqzarium doev not prevent the raoid expansion on the part of the Society. Another Мum.
-- Your correspondent, "Mam," Gardenere' Chronicle, po 684 bringe forth the old obj etion oace mord gaent the holding of the atama exbibition in the Royal Aquarinm. Ho finds all the fault imagiasble, but he ends there, leaving to others the difficulty of finding an alternative place. Finding fault is one thing, saggesting improvements is another; why deva he not name a better place? He half admits the fact that the \(R\),yal Aquarium is central, as it is for visitors and exhibitors alite, and the latter are sarely entitled to some amount of consideration. "Mam", appeare not to know that the whole of St. Stephen's Hall will be devoted to exbibition purposes next year, and this addition will make an enormons difference to the show, providing, as it does, so much extra space. Who knows, too, what other achemes the management may have in coatemplation P Perhaps "Mam" will say where sach a site as he has in his "mind's eye" will be found. \(B\).

THE ROYAL MORTICULTURAL EOCIETY'S COM. MITTEES.-I Baw a note on this nrject in the Gardeners' Chronicle for November 30. It may sarprise some, bat it is a fact, that many gardeners in the provinces seldom or never read the transactions of thene committees, anless it be those of the Scientiff Committee, which have a general interest, though the reports are far too meagre as a rule. Conld not nome procena of devolution be attempted, and a wider interest aroused, by having a few aub-committees (with full powers), which would ait periodically at a
few cantres in the province in Eogland, Scotland, and Ireland, en rapport, of course, with the London Central? I merely throw ont the idea, and the plan need cost very little if each committee paid its own expenser. Ms aim is to suggest nome scheme by which the "Royal" could be brought into cloaer contact with herticulturiate all over the country. Up till now I am not exaggerating when I aay that we provinc al men have nos believed that all the "talent "were confined to London and neigbbourhood, or all the good thinga either. The Royal Horticultural society mould "sit on circait" like Her Majeaty' jidges. There woald be no ot j ction to the necretary of the S jciety, or nome competent member of the Council, presiding at these meetinge, but all the members would need to be local with wide limit. At present we pay little attention, or none at all, to the committees' proceeding in Jsondon, aid when we do, wo discount their transaction on a libaral scale. Fuith is weak. J \&. W.

CRAB8 IN THE GARDEN. - Soms of your corree pondente have recently been calling attention to the varieties of the crab as ornamental abrobe. To any one planting treet, say for an alcove or abaded walk. Pyrus Malus floribunda is a most demirable variety for the purpose. I have anclosed some fraits of th: same. R. M., Newbury. [Our correapondent kindy sent everal atoot of this variety loaded with the fraite, which are yellow in colour, and the size of thore of the Whitethorn. Ed.]
oerbera \(J a m E 80\) ni-A good epeciman of Gerbera Janesoni has done well hese in the open border for several years, though it has had no assistance at all from hot-water piper. I think the plant is certainly larger than that of Mr. Lpoch in the Botanic Garden at Cambridge, though the latter is the more flori'erous of the two. I have alway put a box with the top and bottom knocked out over the head of my plant, and this has been filled un with dry leave to the top. I generally bid good bye to my \(\mathrm{G}=\mathrm{sbera}\) in November, and I afe nothing more of it till the middle or ead of the follow.ng May-though the leaves are all scrapad away fron it at the begianing of April. By the aid of the above simpla precaution, this plant ia manageabie enoagh in the Ille or Wight; bat if my circamsance were like thone of Mro Lunch at Cambridge, I should follow his plan, which I know to be a very good one. He hav the advaniage of a much larger crop of flowera than I evar get, but I estesm my plant to ba a fioer one than his. Which has the advantage, a plant which is grown in proximity to the hot-water fipen of atove, or another which is favoured by the climate o? thy Itle of Wight? H. Ewbank.

PLANTS for game covert.-I thank those of your correrpondente who bive replied to my query on the sbove (see p. 684). I asaure Mr. Harrison Weir my quention was bonâ file, knowing that so few ehrabs were free from is jury by that enemy of tree of thrub growth-the rabbit. I wes ancious to add to their number, if ponsible. As beariag on thi abjuct, I may bere mention a remarl I have used to owners of eatate and others for many jears past, viz, "feeding rabbits on growing tree and ahrub bark is on!v comparable in extravagance to aning new f.5 Bink of Ejpland noter to diah op entrées as a dinner party." However, this is by the way: rabbite are, and will be, kept for aport on most, if nut all, properties where woods and plantation exiat, and it is the daty of those interesed to find out what brobs uselal for c.jvert are the least injured by them. I do not think Rona rognsa fairly comparable as to ite apines with the wild Doz Rome. I hope I hava to: much feeling for both man and bras? to think even o? makiog large plantations of the Dug Rose for covert. Rhododendron panticum is a well-known covert plant, mainly free from injury by rabbite. Thowe of us who are situated on the limeatone formations know, though. that it will no\% grow freely eaough for that parpose. In most casen, it marely exists. In reply "Mr. Pope, I mas mertion, thas with ut Engliah Yews, Ha diworth broad leaved, and the ordiaary Tree Box, ere the only evergrient free from ibjury. Among t deciduous nhrabe. Saingan in variety, flowering Car nt ditto, P. ruian L lacs, D.og-wood, Saowbery, and Eders are not injured. The latter in particalar is never toncbed by rabbit*, even in the hardes winter, and where they are very numerous. H. J. C., Grimston Gardens, Tadoaster.

RABBIT-PROOF PLANTB-Mr. Pupe ( \(\rho .685\) ) akk for the names of thene, and I intended mending a note on the aubj cy ome tima ago. As lat winter was so exceptionally eevere, with the ground covered by suow for several weeks, and the wood anfortanately fall of
rabbita, a remarkably good trial was afforded. The concluaion I arrived at is that no plant ordinarily grown in wood is proof against attack in a severe winter with one exception, viz, Rhododendron pon-ticum-a plant which thrives here in the natural soit, a atiff clay, and is grown in large mases, some of the plante ranning up from 12 to 16 feet, and it abounds in all nzea, from tiny aeedlinge upwards. The rabbits were o preased for food that they died by huadreds, although fed with hay, \&ic., but in no case did they nibble the Rhododendrons. Airegarde the liability of other plante to be attacked, I place them In the following order, tarting with those which received the least iojary, but eeveral of them are about equal in that respect. Yew, Holly, Portugal Laurel, Common Laarel, Berberis aquifolia, Privet Iry, of this lat they ste every leaf obtainable, and in one inatance climbed a broken tree 4 feet, and walked along it 26 feet, at a distance of 4 feet abova the ground ; they also climbed to the top of stacke of green faggote put ap on end, and cleared off the bark and young twigs, and large branches of Beech 1 foot in diameter were barked clean by them. So many died of poisoning by Yew and other herbage, that it was not afe to take the foxhound into the woods alter the froste was over, as they ate the dead rabbity and became ill in consequence. All this tend to show the immanity of Rhododondron ponticum from injary; and where it will grow I consider there is no plant its equal for covert planting-its beanty in pring when in flower is well known, and appreciated. Hgbrid Rhododendrons are not so afe from attack here, possibly because they grow more alowly, and rabbits have a remarkable tendency to attack anything recently planted, or standing in an isolated position, as choice thioge often do. W. H. Divers, Belvir Ca•tle Gardens, Grantham.

THE IMPORTATION OF HORBERADIBH.-I WAS very pleased to read your article on this aubject in the last week's issue. Mr. Mason's facts cannot be too widely known. Horseradith nowaday has no flayour or pangency. One seldom meete with any now at reaturants, hotels, or greengrocers, bat what one could eas a dishfnl, comparatively speaking.
without tasting the old Horseradish flavour of one's youth. Then all was English-grown; and the secret is one of cheapness of production. The foreign roote are cultivated in a mont inexpenaive way, and are sold at a lower price than the cont of prodaction is here. I wonder Mr. Mason did not explain the differenc 3 in the atyle of cultivation in Eagland and in Holland, where most of this tasteless atuff comes from. I also wonder that he and other Eaglich grower: do not cultivate the root in the cheap way the Datch do, seeing that the British pablic prefer cheap and tanteless roots. In Holland they plant in April, the snags, or long thin rootlets at the base of every old root, about 8 or 9 inches apart each way. There enlarge daring the aummer growth, and being dag up in November, form the article oold as imported roots (an old root enlarged). Eaglith cultivation in very different, and much more contly. The crowns of large roote are cat off about 4 inches in length, and planted in Febraary, I believe about 1 foot apart in the rown, 2 feet from row to row, and 1 foot deep. Each crown is worth a penny, which, together with the amnunt required for labour, entails a cont of aboat \(£ 60\) or \(£ 70\) per acre for planting only. The planted crown throws a shoot up to the surface of the ground, which enlarges to about the thicknena of the parent crown; and in November, when the growth is finished, trenches are dug between the rows, and the now growth of 1 foot cat away from
the old crown below, and the article sold by Eaglish growers, being a new fresh-grown root, full of flavour, and not a piece of old tough root enlarged. The imported roote come over packed tightly in enormoas barrels, and anyone may know them in the thops; they are dirty-looking, and have a little lesf grown and bleached in the barrels. English grown roote look much fresher and cleaner, and have a little tuft of green leaf just beginning to grow on the crown. Aay one who trie the Eaglish roote against the Datch will soon detect the difference in the flavour and atrength; and while he is tatiag the Eaglish, he will "weep" to think be ever booght or encouraged the foreign root. Alfred

CHAYBAMTHEMUM, M. CHENON DE LECHE. -The engraving in last week's Gardeners' Chronicle, p. 683, represents this charming variety in ite true character. Tarieties introduced during the lant few yearn, The
colour is so diatinct from any other, and so pleasing, that it is mure to find many admirers. I saw the bloom: staged at the R jyal Aquarium Show, and at Hall too it was a prominent feature in Mr. Wella atand. I regard this Japanese as one of M. Calvat's beat introductions, and one that will find favour wherever seen, E. Molyneux.
a4B-LIME.-I can assare yoar correspondent, \({ }^{\text {s }}\) R \(D_{\text {." }}\) that gas-lime, used in the tresh atate, in the quantitien I mentioned, a id in thy way directed in my Calendar in the antamn of the year, will be quite afe for him to recommend when lectaring. No ill-effect will be visible the following season; but inatead, if good caltivation be given as well, the oil will not only grow good vegetablem, bat such as will take priz3. This I have proved for a namber of years; and others who have seen the crops that I have grown will corroborate the atatement. I should certainly not hava recommended the use of fresh gaslime without having fully tented it for yeara. John Lambert.
begonia qlotre de sceaux.-I find thi useful free-flowering Bagonia of great service for decoration at the present season and later in the jear. The flowera of a soft pink colour contrat pleasantly with the rich bronze foliage. I uaually propagate the plant from "eyes" in a brisk heat lite the Viae in the spring, inserting these in light sandy coil, and keeping the latter rather on the dry side till the root have pashed, and when this occurs, hoots quickly appara above the soil; and the cattings, if they are then carefully potted, become soon ready for hardening off and placing in a cold frame. The plants with ordinary attention do very well in cold frames throughout the season and make good plants by the autuma, at which season they should then be taken into a house or pit having a temperature of \(50^{\circ}\) to \(55^{\circ}\). Daring the summer, manare-water should be frequantly
afforded to all the well-rooted plant. H. Markham.

\section*{LATE FLOWERINQ VARIETIES OF CHRYBANTHE-} MUM8.-Several of your correspondents have lately spoken of varieties of Carysanthemume suitable for flowering at Christmas and later, but none has mentioned Princens Victoria, a variety which I connider the beat of all for the purpose. This variety has a good habit, and, being a good grower, it makea atrong compact bushes from 3 to 4 feet high, if stopped once in the apring; and the blooms are good, either on specimen plants, or, if not diabudded, as apraya. Last Christmas my only two plants were grown aide by aide with L. Canning and other late-flowering varieties, none of which was equal to it in usefulness or beanty. This year I have about thirty atrong plante in 8 or 9 -inch flower-potes, and they are jant commencing to open their bads, and will be in perfection at about the 30 jh inst. I intend to diecard Lady Lawrence in farour of Princens Victoria. I aend a apray from the earliest plant for your opinion; also apray of another varisty named Florence Watson, an importation from Japan, which, I think, will make a good late white, R. Watson, Elkington Hall, Louth. [The blooms sent of Princess Victoria were of usefal decorative size, white, with lemoncoloured centre, outer florets becoming pink with age. Apparently very free in blooming, but compared with L. Canning the blooms are lens white. Should the habit of this one be better than L. Canning. the variety is doubtless of firat-rate usefulnem. Thome of Florence Wateon mentioned by our correspondent on aprays unthinned have broad, pare white Aloreth, elightly incurved, young floret dintinctly lemon-coloured. Some mistake appearm to have been made in putting up this bunch, however, as the large blooms from thianed shoote are very deep, the floreta are namerons, narrower, and fated, and little trace of lemon in the centre. They are preamably two varieties, and the broad-floretted one is decidedly pretty. ED ]
pear lucy Grieve. - I was pleased to see the Pear Lacy Grieve figured in your last week's isme, and to read the touching lines in verse by fond parent, now departed, in memory of his little daughter and her seedling Pear. Partly from the tnuching incidente connected with the origin of the Pear, I got a maiden plant of it a number of years ago, but it has never fruited with me. It is on the Qaince, on which etock it is a weak grower, and evidently thy bearer. However, I am not yet withont hope of neeing Lacy Grieve in truit in East Lothian.

TREE-PLANTIMG AT EXMOUTH.-The inference to be drawn from your note ( \(\mathrm{p}, 650\) ) respecting this
is, that the syetem has only but recently bzen introduced. Thank to the generonity of the Lord of the Manor, many of our principal roads were planted several years ago, others were planted last neason, and at the present time we have nica avennes of trees, principally Limes. I regret, however, to ay that this autama the public have taken the matter up, and very few Limen, or what, perhaps, would be more nitable, Planes, are being planted; and oar bearatiful eaplanade-perhaps one of the finest in the kingdom-has been disifgured by being planted with a mixed collection of Horas-Cheatnuts, Sycamores, Balsam, Lombardy, Black Italisn, Silver, and other kinds of Poplara. The Chestnuts will certainly be a failare, for the situation is mach exposed to the ea, and in galea they will get every leaf blackened. I may add, that aince the tree were planted many have been beheaded to bring them into shape. It is a matter of regret that the Council were ao ill-advised a to consent to the planting of auch varieties, for it only brings street tree-planting into disrepate. Ermosthian. [The kind named are not, parhapa, the best that could be chosen. Still, the onily really unsuitable one is the Horse. Caestnat. Ed.]

\section*{SOCIETIES.}

\section*{ROTAL HORTICULTURAL}

December 10. - The maeting3 and exhibitioas for the present year were brought to a close on Tuesday last by that
held in the Dill Hall, James Street, Westminster. As is usual on occasions immediately preceding the Christmas season, there was a lirge atteadance at the several committees and particularly in the case of the Fruit Cummittee, whosa passed in ooaneotion with Mr. Barron's ret'rement from this position is referrel to on another pige. Notwithstandiag the unusual attendance upon the committees, the extent of the exhibits was not larg3, and two of the long tables furnished saffient accommodation for them all, excepting a group of Chrysanthemum plants. Orchids, cut Chrysanthemum \({ }^{\text {, fruit }}\) and vegatables, and a few miscellaneous plants of interest, comprised the exhibition.

\section*{Floral Committee.}

Present: W. Marshall, Esq., in the chair; with Me:grg J. Fraser, J. Laiag, H. B. May, H. Herbst, R. Daan, R. Owan, G. Stevens, J. Jenningz, G. Gordon, W. Bain, H. Cannell, J. D. Pawle, H. Se fe-Leonard, G. Nicholson, C. Jeffries, C. E. Shea, J. W. Barr, J. Walker, J. T. Bennett-Poë, H. Briscoe-Ironside, C. Blick, G. Paul, H. H. D'Ombrain, and Harry Turner.
From the gardens of Sir Trefor Lawbence, Bart, Bufford, Dorking (gr., Mr. Bain), came a number of cat spsthes of hybrid Anthuriums, all of them pretty; also a panful of well grown plants of Primula floribunda, a very pretty little species from China, with yellow flowers, blooms during most of the winter (Silver Banksian Medal).
J. P. Bemetr-Pot, Esq., Holmewajd, Cheshuat, aguia exhibited the plant of Begonia \(\times\) incomparabilis, raised by Mr. Froeb sl of Zurich, and figured in our last issue.
sbout eighteen plants of seedling varieties of Primu'a sinensis, illustrative of an excellent strain, but hardly in full flower, were shown by Mesgrs. Hy. Cannell \& Sons, Swanley, who had also some good sprays of varieties of Canna, including Queen Charlotte and Alphonse Bouvier, the latter a very effec ive crimson-scarlet colour.
Mr. C. Herrur, The Gardens, Dropmore, exhibited a few plants in flower of Oxalis Ortgiesii, a spacies bearing amall yellow flowers and darr bronzy wedge-ghap yd leaflots (Vote of Thanks).
Chrysanthemuns were again shown by several exhibitors, but the only award gained on this occasion was one by a decontive variety, named Stress, exhibited by H. Briscoer Ironside, Ksq. Cedar Lodge, Bayes Hill, Sussex. A large number of the blooms were arranged in «stand in an effective manner, and the decorative value of the very soft yellow-coloured blooms was well illustrated.
Mc. Robert Ower, nureergmin, Maidenhead, had a fairly large collection of new varieties, includiag Mrs. C. E. Shes, J. W. Richardson, Midame Eugene Mercier, and a number of seedlings (Silver Banksian Medal).
A group of Chrysanthemums, shown by G. H. F. TKREs, Bsq , Chislehurst (gr., Me. J. Lyne), was composisd of plants of Jeanette Sheehan, a sport from the whiteflowered Priaceas Blanche, with vellow flowera, having a broozy centre. The variety was given an Award of Merit by the society in January last, and is apparently very free-flowered, baside being pretty and attraetive (silver Banksiau Medal).
A new patent Orchi 3 -basket was exhibited by Masars. Seasele Eox, 135, Richard'd Road, Heelsy, Sheffield, the chief ianovation in which is a saucer-shapad top, by which it is claimed the water given is throwa to the contre of the compost.

\section*{Orchid Committee.}

Pris:nt: Harry J. Veitch. Etq., in the chair ; and Mesers. Jas. \(0^{\prime}\) Brien (Secretary), Dr. Maxwell T. Masters, J. Jaques, E. Hill, J. Douglas, W. Cobb, S. Courtauld, H. M. Pollett,
I. W. Bond, De B. Crawshay, A. H. Smee, H. Ballantine, H. J. Chapman, W. H. White, E. Ashworth, T. B. Haywood, and R. Brooman-White.
The last meeting of the year brought a good attendance of the members of the Committee, and the exhibits, for the sacon, were good and interesting.
Sit Trevor Lawrence, Bart. (gro, Mr. W. H. White) as ussal, contributed some remarkable plants, the most admired of which was a pretty specimen of the rare Dendrobum Treacherianum, whose dwarf Bulbophyllum-like growthe bore Treacherianum, whose dwart Bulbophyllum-1ike growth bore three short spikes bearing together twenty-three large rose
coloured flowers with dark crimson base to the lip. The plant was awarded a First-class Certificate, and a Cultural Commendation was alloteri to the grower.
A Botanical Certificate and Cultural Commendation were aliog given to a noble especimen of Angreeum pertusum with Butanical Certificate for the pretty Masdevallia pachyura, with red-brown and clear yellow flowers, and which was now shown for the first time, the plant which has hitherto borne
the name in gardens being M. caloptera, a totally different and the name in gardens being M. caloptera, a totally different and
smaller species. Sir TREVOR LAWEETCK also showed the rare Marmodes La wrenceanum (Lindenia, t. 275), (Botanical Certifcate); a giant rariety of Masd ovallia macrura (Award of Merit), the extraordinary large Bulbophyllum grandiflorum,
Dendrobium Coslogyne, and the white and rose forms of İli tubscens.
Baron Sir H. SoHroder, The Dell, Egham (gr. Mr. H. Ballantine), sent a most beautiful collection of cut flowers of
Cgpripediux \({ }^{\text {s }}\), representing some sixty finespecies and varieties, Cgpripediuxs, representing some sixty finespecies and varieties,
and for which a Silver Banksian Medal was awarded. Of the mostystriking, we noted the two yellow Cypripedium insigne Sandere and \(\mathrm{C}_{\text {, }} \mathrm{i}\). Sanderiana, the former yet far and away the best of yellow insignes; C. \(\times\) Southgatei, C. \(\times\) T. B. Haywood, C. \(x\) Arthurianum, C, \(\times\) Harrisianum superbum, C. \(X\) unnamed hybrids a handsome flower obtained between \(C\). Druryii and C. 8uperbiens. In the group also were flowers of the pretty Cologyne Arthuriana, a near ally of C. maculata,
but demonstrated by the late Professor Reichenbach to be but demonstrated by the late Professor Reichenbach to be botanically different. As a garden plant it is cer
J. T. Bennett-Poe, Holmewood, Cheshunt, staged a very pretty group, of which the centre was formed by a very graceful arrungement of fine spikes of various Calanthes; with them Was a remarkable noble variety of Lycaste Skinneri, named coerulea (Cultural oommendation), and a singular variety of Lelia autumnalis, with large pure white side lobes to the lip. a silver Bdnksian Medal was a warded for the group.
Messrs. Jas. Veircia \& Sor, Royal Exotic Nursery, King's
Boad, Chelsea, staged an effootive group of rare plants, among Boad, Chelses, staged an effective group of rare plants, among
which one of their latest and most beautiful novelties, Laelio-Catuleyax Lady Rothschild (C. Warscewiczii ó, Lælia Karrini o) made its début, and secured an Award of Merit. The flower in size approaches C. labiata, but the form of the lip follows closely on that of L. Perrini, though in the hybrid it is of more ample form, and brighter in colour. The sepals and petals were of a clear rosy-lilac, the dise of the lip prim-rose-yellow, with some beautiful purple markings at the base, add a bright purple front lobe. Another fine hybrid shown by Kessrs. Vercie was the pure white Calanthe \(\times\) Harrisi
(Turneri \(\times\) Veitchii), which received an Award of Merit (Turneri \(\times\) Veitchii), which received an Award of Merit, and noteworthy things were Loelio-Cattleya \(\times\) Pallas (C.
Dowiana \(\times\) L. crispa), the rare Oymbidium Traceyanum, and sereral others (Silver Flora Medal).
Mesgrs. F. SANDER \& Co., St. Albans, staged a very effective group of their various new wiater-flowering Oalanthes, together with Phaio-Calanthe \(x\) Arnoldiana, Leelia anceps elba, Helcia sanguinolenta, Restrepia antennifera, Odontoglossum aspsrsum, O. Schroderianum, O. Nevadense, 0. Wulckeanum, and numerous hybrid Cypripediums (Silver Badkaian Medal).
Mewr. B. S. Wriliams \& Sov, Viotoria and Paradise Nurseries, Upper Hollowsy, N., showed a good collection of Oypripediums, among which we noted the noble C. \(\times\) Pitcherinum, Williams var, and others.
Thos. Statter, Esq., Stand Hall, Whitefield, Manchester (kr., Mr. R.Johnson), sent the handsome Cypripedium \(X\) Lacienianum superbum, C. \(\times\) Leeanum giganteum grandifloram (perhaps the largeat of the C. \(\times\) Leeanum), \(0 . \times\) plumosum, C. \(\times\) Niobe splendens, \(\mathrm{C} . \times\) Rufus (a richly-tinted Lawrenceanum crose), C. \(\times\) Ariadne, Leelia \(\times\) elegans nobilis, a very fine and richly-coloured variety; Leelio-Cattleya Trenederiana superbs.
H. TATE, E:q., Alle
Mr. TATk, E:q., Allerton Beeches, Allerton, Liverpool (gra, Mr, Osborne), cent Cypripedium ingigne, Tate's variety. The form appenred in the midat of a mass imported by Mesors. T. Sander \& Co. in 1892, whicn has been grownon all together. Tate"s variety, on which there were two flowers, is remarkable lor having the upper and lower sepals alike, and the usual sepal on both apper and pure lip of the ordinary variety's dorsal T. W. \&wruper and lower.
C. W. SwIMBume, Esq., Corndean Hall, Winchoombe, mong which were the pretty \(0 . \times\) Swinburnei, with nine blooms; \(0 . \times 8\) winburnei magnificum, whose massive flower typers diffecult to reconcilo as being from the same cross as the fase, vrietiee of \(O . \times\) Inown to be 00 ; the protty \(0 . \times\) Indre,

With ten flowers; the very singuiar and distinct \(\mathbf{O} . \times\) Lady Hutt (insigne \(\times\) Fitchianum), a noble flower, in some respects like a maseive C. \(\times\) Ashburtonies, but having a largs yellowcoloured staminode, and incurved lobes of the lip of the same clear colour.
Mesers. HUGR Low \& Co., Clapton, arranged a group of Orch ds, in which were two fine warieties of Cymbidium giganteum, Cycnoches chlorochilon, and others
W. C. Walker. Esq., Percy Lodge, Winchmore Hill (gr.,
Mr. Geo. Cragg), showed Lelia rubescens, Oncidium prgetexMr. Geo. Cragg), showed Lelia rubescens, Oncidium pretex-
tum, and a Cypripedium Charlesworthii, with curiouslywisted sepals.
G. Shoreland Ball, Eeq., Earlscliffe, Bowden, Cheahire, sent the rare and beautiful Cattleya labiata alba in better form than it has before appeared; Cypripedium insigne Sandere, and C. insigue Ballianum, a charming clear yellow form, with broad, pure white upper-half to the dorsal sepal, on which were froad, pure white upper-half to the dorsal sepal, on whiches, suggesting shadows of the blotching reen in C. insigne Chantinii.
Messrs. W. L. Lewis
Messrs. W. L. Lewis \& Co., Southgate, showed Cypripedium flower, regembling the \(C, \times\) Alfred Hollington (Award of Merit).
D. B. Crawshar, Esq., Rosefield, Sevenoake (gr., Mr. S. Cooke), sent a fine form of Oncidium tigrinum (Award of Merit): and F. W. Moore, Esq.. Royal Botanic Gardens, Glasnevin, Du blin, showed Oncidium pictum.

\section*{Fruit Committee.}

Present: Philip Crowley, Esq., in the chair; and Messrs. T. J. Saltmarbh, W. Wilks, P. C. M. Veitch, G. W. Cummins, Jas. Cheal, A. H. Pearson, J. Wright, Alex. Dean, C. Herrin, J. Willard, Charles Ross, J. W. Bates, Wm. Pope, G. H. Sage, Geo. Wythes, Jas. Hudson, F. Q. Lane, A. Balderson, C. Reynolds, Jas. Smith, G. Norman, Dr. Robt. Hogg, and Jno. A. Laing.

Some fruits of the tree Tomato (Oyphomandra betacea) were sent by the South Devon Erait Farm, Torquay (T. Psnder, Manager). Seed was obtained from Ceylon, and sown in February, 1894, and the plant grew a great height, but did not fruit. After shedding its leaves, the plant was cut down to 1 feet, and this season it haser rown to 12 feet high, with branches 60 to 12 feet long. The flowerd are produced in bunches like Solanums, and the plant has carried fruit at every joint.
The fruits shown were about the size of a emall hen's egg, but were not quito ripe. Tce plant has always been ia a coolhouse, and it is thought that the fruit will never ripen
suffiently early to be profitable without fire-heat. Many Particulars concerning this fruit were given in the Gardener

The only collection of Apples and Pears was one from Ford Foley, Ruxley Lodge, Eeher (gr., Mr. J. W. Miller). There were upwards of forty dishes, and included were good specimons of Beauty of Kent, Sandringham, Blenheim Orange, Mannington's Pearmain, Court of Wick, Lord Derby, and many others (Vote of thanks).
Soedling Apples again occupied the attention of the committee, but no awards were given, though the committee are desirous of seeing some of the kinds at a later date.

Mr. CHas. Ross, gr. at Welford Park, had Opal, a amall yellow fruit, in colour like Golden Noble. Mesars. Jarmant \& Co., Chard, Somerset, had fruits of Crimson King Apple, a fair sized fruit, highly coloured, exhibited together with a young tree of the same variety
Mr. W. Empson, Ampthill, Beds, exhibited Ampthill Seedling and Easter Russet Rippin. Mesars. Laxton Bros., Bedford, had Lazton's Bedford Scarlet; and the Right Hon. Bedford, had Lazton's Bedford Scarlet; and the Right Hon.
Lord ST. Oswald, Noatell Priory, Wakefield (gr., Mr. Jno. Lord ST. OSWALD, Noatell Priory, Wakefield (gr., Mr. Jno.
Easter), showedigood dishes of Queen Apple, Alezander, and Easter), showedigood dishes of
Prince Albert (Vote of thanks).
Messrs. Dobbit \& Co., Rothessy, N.B., exhibitod some very well-grown purple and green Kales, to be known as the Victoria Kale. They were very remarkable for the cloce curling of the leaves (Award of Merit).

Meoars. H. Canneli \& Sons, Swanley, brought a few Savoys; several varieties of Beet, of good shape and colour, and not over large, notably, Best-of-All and New Purple; some Cannell's Mammoth Leele, and a collection of Onions in variety, the produce chiefly of field culture, bat exhibiting nevertheless, very large size and perfect ripeness. Very fine new forms were Lullington Park Eero, Cannell's Globe, and Southport Red.
A collection of Onions, in about thirty dishes, shown by the Earl of Carnarvon, Highelere Castle, Newbury (gr., Mr, Wm. Po pe), was well worthy of remurly by reason of the aizo and solidity of the specimens. Such varieties as Sutton's A1, Ailss Craig, The Lord Keeper, Sutton's Crimson Globe, Cranston's Fxcelsior, Veitch's Main Crop, Toogood's Southampton Champion, and Rousham Park Hero, were of excellent exhi bition size and quality, but emaller specimens of the same varieties were of equal quality at least, and as convenient. There were two seedling varieties of uncommon shape, but most nearly like Cranston's Excelsior, having a largo, almost crimson flat base, tajering to an unusual degree.

\section*{ALDERLEY EDGE AND WILMSLOW HORTICOLTURAL.}

November 29, 30,-1 successful show was held in the Drill Eall, Wilmalow, on Friday and Saturday. The coupptition in most of the clames was gool, and constlering the leteness of the date, fine blooms were exhibited.

Col. Dixon, Atle Eall, the Freident, opened the show, and
large aumber of visitors wiere preent on both divy.

The committoe are to be congratulated on the reenlt of their first effort, and it is hoped that the ahow will become a permanent fisture. The frait shown wes very good, and indeed, ezhibits generally were praiseworthy.
One feature of the show was a raried collection of Orchids exhibited by E. A. Hworte, Esq., Harefiold Hall, Wilmalow (gr., Mr. E. Holbrook), which was much admired. A amallor and select collection was shown by Dr. HoDGuwnow. The Grange. Wilmslow (gr., Mr. J. Worre).
Messrs. Clibran i Sors, of Altrincham, sent plants and cut flowers, also a fine collection of fruit; Mesars. Jormsosa a WheELER, of Cbesterfield. cut blooms of new varietied of Chrys anthemums: Mesars. Caldwels \& Sons, Knutaford, eent Conifers, \&c., to decorate the room, and also showed allec tion of Cyclamens, \&c., these various trade ezhibito eddiag much to the attrac tive ness of the show.
Ia the looal clases, honours were gaised by Mm. BrapLEY (gr., Mr. Geo. Heap), followed by R. B. Limgand Momi, Erq., J. White head. Req., H. Herrar, Eecio, and O. Har Reson, Eeq. (gro, Mr. W. M. Williams).

\section*{HIGHGATS AND DISTRIOT CHRTE. ANTHEMUM.}

DECEMBER 4. - The eleventh annual dinner of this Society took place on the above date at the Winchester Hall Hotel, Archway Road, Highgnte, and Charlee Catling, Eeq.o the Preaident, occupied the chair. There were more than 100 members and friends present.

The chairman, in proposing the toast of the evening-"The Highgate and District Chryanthemum Eociety "一riforred to the success of the recent show, which he enid wns the finet yet held.
Mr. Percival Hart, last jear's President, proposed "The
President and Chairman," and congratulated Mr. Catling on President and Chairman," and
the succese of his year of offlee.
The chairman briefly responded, and alladed to the strenuoan manner in which the committee had worled throughout the year. He afterwards presented the Medals awarded at the recent exhibition, which were as follows:-Bilver Medal of the Natipnal Chrysanthemuma Sooiety, to Mr.J. Brookp, gr. to W. Reynolds, Esq., J.P., Highgate, an addition to the the lat prize for a group of Chrysanthemums; Ryecroft Medal (presented by Mr. H. J. Jones, Lewisham), to Mr. A. Page, gr. to A. Taycor, Eeq, Southgate, for twelve Japanee e blooms; Bronze Medal of the National Chryeanthemum Society, to Mr. T. L. Turk, gr. to T. Bonex, Req., Highgate, for twelve bunches of cut blooms.

\section*{NATIONAL CHRYSANTHEMUM.}

DECEMBER 11.-As is usam at thip, the last meetion of the committee for the yesr, only a few novelties were staged, but the interest in the meeting was conaiderably enhanced by a collection of several boarde of fine blooms of novelties of a very interesting character, to which amall Silver Medsl was a warded.
First-class Certificates of Merit were given to Japanese Mrs. B. W. E. Murray, a full, symatrical, pure white incurved flower, the petals narrow, but plenty of them, from Mr. R. W. E. MURray, Blackford House, Rdiaburgh; to Japaneee Janetto Sheahan, a pale yellow aport from Princean Blanche, two finely-bloomed, dwarf, bushy plants, being oxhibited; it was Certificated as a late-flowering decorative and marlite variety.
Messrs, Jonmson \& WHEKLRR, nurserymen, Chenterfield. ent incurved \(\mathbf{H}\), W. Roeman, of a bright pure golden colour, which the committee wished to see again. From Measre. H. CANNELL \& Sor, nurserymen, Swanley, came Goldfield, a deep golden incurved Japanese ab ahown, which the committee asked to see again. It was ahown at the mesting of the Royal Horticultural society on the previous day as Ashanti, but the exhibitors apparently thought it expedient to chenge the name! A vote of thanks wae peesed to Mr. Thomas Bevan for his services as chairman of the Floral Committee during the past year, which was suitably acknowledged.

\section*{EDINBURGE ROYAL BOTANICAL.}

\section*{Plants in Flower ix the Glrdem.}

Asystasia scandens is a climbing plant which is perhaps better known under the synonym of Henfrey scandene, and a specimen planted out is now flowering in one of the stoves It in not a plant of vigorous growth, and raches a height of aboat 6 feet or thereabouts. The strmis, dark shining erean, are bwollen at the podes, and they bemr oppositedark green leaves, upon which the venation is very prominent The inflorescences are terminal, and are borne upon the short branches, in racemes carrying a good number of whito flowers 2 inches across the lobes; and the anther are black. As grown, it is very floriferous, and at this seacon is a very acceptable addition to the warm-house. It was introduced from Sierra Leope
Mag., t. 4449.
Jasminum pubescens.- Where cut flowers are in demand during autumn and winter months, thia favourite should not be forgotion, becaute of its fragrant white flowers. It is a native of Chins and India, easiy grown as a pot plant or Then planted out in a border. Afforded a good position in an atermediate, or cool stove temperature, more growth by plants in bordere is made, and consequently there are more Howering shoots. In gardens it is uften seen under the zome of J. hirsutum.

Cardioperalum gumifer um. -4 plant af this New Boect
the latter) has been in bloom for the past three or four months. The foliage is opposite, the ternate leaves having their leaflets with serrated margios, and it is evergreen. The terminal panicles consist of loosely-arranged flowers, in which the sepals are very prominent, and the petals small and divided into three pointed segments. The yellowish-white sepals turn, at the preeent time, to a pinkish colour, a change that brings at the preeent time, to a pinkish colour, a change that brings
them into more prominence. A good bugh of this plant would proveattractive. It is grown in a rather rich compost in a cool greenhouse among other Australian plants.
Reinwardtias.-Every year at this seanon we are reminded of the usefulness of these old plants in brightening and beautifying the stove ar warm greanhouse. The two species, R. trigynum and R. tetragynum, are both in full flower. They are somewhat similar in their flowers, but distinct in habit and foliage. The first is compact in habit, with entire ovate leaves, growing in pots to a height of 1 to 2 feet, but when planted out as here, it grows to between 2 and 3 feet, and oven higher, carrying hundreds of flowers, and forming a compact bush. The variety R. tetragyna is of a straggling habit, with larger elliptic serrated leavey, and rather larger flowers of a lighter yellow colour. Both vanoties are easily propagated from outtinge in the spring, and they may be placed in cold frame during the summer, with abundant water at the roote, and copious syringing to keep down red-spider, to which the plants are very subject. They may be kept antil their flowers appear in a cool greenhouse, and then placed in gentle heat to cause the flowers to open freely, which they will continue to do for a considerable length of time.
Eucharis Sanderiana, and other Species.-This specie named is not so well known as its merits deserve, for it possesses bold foliage on short petioles, shorter leave,, which have a mo'e conspicuóus venation than in the well-known E. grandiflora. The flowers are of great substance, the perianth not reflezed, and the corona almost absent. It was introduced by Messrs. Sander in 1888, from New Grenada. E. candida is also flowering here, its long peduncles calrying blooms in which the corona is very apparent, while the leaves are smooth, on long petioles. E. Mastersii, introduced in 1885, shows sigas of Aoweriog. All the above varieties of Eucharis ave worthy of a place in a stove. R. L. Harrow, Edinburgh,

\section*{The Weather.}

Cycas STEMb, an a rale, do not produce branches very freely, but in the Paris Jardin des Plantes an old trank which has been injured has produced lateral branches, and a whole colony of lateral bude, now about the aize of egge, are in course of formation. No perfect leaves exist at present, 20 that the neteres is undertain.

Chrysanthemum and Fruit Show in Car. LIBLE.-On Monday, December 9, a large meeting of gardeners and other interested was held at the Bush Hotel, Carlisle, for the purpose of dincuning the desirability of promoting a Chrysanthemum flower show at Carliale. Mr. C. Lonadale, Rosehill, in the chair. After some discusion it was decided to form a ociety to be called the Carlisle and Cambyrland Horticultural Society, and to hold a Chrysanthemum and fruit show under it aupice next antumn, and possibly a flower show at an earlier date. Mr. Sale, of Botcherby, was appointed necretary protem, and the committee then proceeded to appoint office-bearers. The Mayor of Carlisle was appointed president; a large number of gentlemen reniding in the district were appointed vicepresidents ; Mr. Watt, jan., Knowefield, was elected treaarer, and a working committee was likewise appointed with Mr. C. Lonedale a! chairman. Another meeting will be held in the same place aext month, for the purpose of drawing up ralen, lints of premiams, \&cc.

Agabicus: \(X, Y, Z\). What is called the "Sclerotiam" of mome fangas, a kind of bad which remain dormant for a time, and then, when times change, develops into mycelium or pawn. We cannot tell you what the fangus is-very likely it is a atate of the common Muahroom. In any case, if you pick it out, no harm will arise.
Cirtificate in Botany: G. H. H. Yei ; write for particulars to the Secretary of the Science and Art Department. South Kensington, London; or, for horticaltaral botany, to the Secretary, Royal Horticaltural Society, 117, Victoria Street, London, S.W.
French Buan Flowers Droppine: Vindex. The general warmth of the hone is too low. It is true that the seed will germinate at a minimum temperature of \(60^{\circ}\) Fahr, bat something bigher is needed for rapid growth, together with the follest amount of anlight, and a moist heat. No manurial aids are required until a good crop of pods is set. Want of light at this season induces poor development, and your planta may do better at the day longthen.
Frut and Viartable: \(G\). \(G\). Theme popular terms need no definition as regards the eense in which they are understood in gardens. As you must know, many vegetable production are fruit in the sense that they contain the meeds of the plant, as, for instance, Peas, Beant, Tomaton, Vegetable Marrow, Cacumber, Chillies, \&c., which are used as vegetablen. "Vegetables" may consiat of the entire plant, or part of it, minu the seed-vensels.
"Jourgal of the Royal Horticulyoral Society" A Conotant Reader. Apply to the Secretary, 117, Victoria Street, S.W.
Names of Fruit: Masters, Warwick. Pear Vicar of Winkfield. - R. M., Newbury. Freah-coloared Apple King of the Pippins ; and green-striped Apple Striped Beefing.-W.J. W. 4, Cockle's Pippin; 6, Claygate Pearmain ; labela on other detached from fruit, -G. T. M. Applen 2 and 6, Scarlet Nonpareil; 4, Prince Arthar; 7, Colonel Vaughan, othera not recognieed. - Serpell. Appears to be Tyler's Kernel.
Nanks or Phasts: Correspondents not answered in this issue are requested to consult the next number. N. C. 1, Matricaria inodora; 2, Sedum apuriam; 3, A grass, with foliage only.-R. Maries. The letaer Cymbidium is C. giganteum, the larger C. Traceyanum, formerly very rare, but now appearing more plentifully.-W. S. The seedling seema to fail to detect a variation of Zygopetalum Mackayii. We fail to detect the alightent botanical difference from the type. Probabiy the cross wat not effected.I. R. Babiana atricta.-E. J., Aberdeen. 1, Davallia Tyermanni; 2, not possible to name from the imperfect barren frond sent; 3, Lastrea Glabella; 4, Pteris argyizè; 5; Adiantum Baimite;

1, Saxifraga cæspitosa; 2, Pceriz cretica albolineata; 3, Lastrea aristata; 4 , Pteris tremula; 5. Applenium bulbiferum; 6, Adiantam caneatam grandiceps.
Notice to Leave Emplotmbnt: \(\boldsymbol{R}\). A. If there in no serious fault on his part, the gardener living in the entrance lodge is entitled to one month's wagen; and if he is obliged to remove forthwith he can claim compenation for lodging, coals, light, \&c., if he have these perquisite, for the space of one month from the date of notice.
Orchids: \(R, T\), Falkirte. The finent \(\mathrm{D}_{3}\) Wardianum we have seen. The other is Cymbidium Traceyanum, illustrated in the Gardensrs' Chronicle, 1891. It was an extremely rare plant, bat recently we have seen several specimens.
Pear Auguste Mignard: \(H\) of Sons, and J. Barnett. We find that this variety, described by the late J. Scott of Merriott, is mentioned in their Guide Pratique by the Brothers Simon-Louir of Metz, which was pablished in 1876. It is there said to be a variety (raised by Gregoire) under trial.
Royal Hobticultural Society: Bot. If you mend in your request, together with the annual subacription, to the Secretary, 117, Victoria Street, Westminater, your name will be proposed at the next meeting of the Society, and donbtlens you will be accepted as a Fellow.
Seedling Pelargoniums: \(B, \notin R\). The variety you send is one which produces a very large trase, but the individual blooms are not nearly to fine as many varieties already in caltivation.
Sondews: \(L\). \(G\). Aldrovanda vesiculoss is mentioned by F. von Maeller, Fragm. vol. 7. It is Australian. Riridula dentata, was figared in our pages, Sept. 26, 1891, and in the ame issue are figurea of Drosera dichotoma, D. capensia, D. pathulata, and Dromophyllum lusitanicum. The apecies of Byblis are B. gigantea and B. linifora, the former having the synonym Lindleyans, and the latter those of filifolia and corralea. Both species were introdaced in 1848, B. gigantea coming from the Swan river
diatrict. Polypompholyx numbers four mpecies, diatrict. Polypompholyx numbers four species, viz, bicolor, laciniata, introduced in 1847 ; maltifida, and tenella, introduced in 1855. Most of the Sundewe and allied genera will grow in aphagnummons avd a mall quantity of peat in well-drained pots atood in pans of water; and propagation is by means of seeds, and atrong piecen of the root cut into 1 inch or \(\frac{1}{3}\) inch lengthe, placed in ahallow pans, and slightly covered with wandy peat, and put under a bell-glam. In five weeks there pieces will be fit to pot singly. Mont of them nucceed under greenhouse or intermediate-house condition.
Tree Labels: E. R. Oaken atump 3 feet long and 3 inche square, charred for a distance of 2 feet from the lower end, and driven into the ground to a depth of \(1 \frac{1}{2}\) feet, are as good as any, being very durable, and not easily drawn out of the earth. The top should be cut at a convenient angle to seceive the name or number, which should be in black oil paint on a white ground. The reat of the label hould be painted either of a green or slate colour.
Turnip: W. C. No larva found,

\section*{AKD GIXPEKCE FOR EVEBY ADDITIOMAL LINE.}

It set ncrowe two Columns, the lowest charge will be 20. It set acrose three Columas the lowest oharge will be gos. Page R8: Half Page, et 10s.: Column, \(\mathbf{E} 3\).
Gardenkre and others Wanting Situations. 26 words, including name and address, 18. 6d., and 6d. for every additional line (about nine words) or part of a line. These Advertisements must be prepaid. This scale does not apply to announcements of Vacant Situations, which are oharged at the ordinary scale.
Births, Deaths, and Marriages, 5s. each insertion.
Posirion.-Advertisers are specially requested to note, that under no circumstanoes whatever can any particular position be guaranteed for advertisements occupying less space than an entire column.
Notici to ADVERTISERs.-In many instances Remittance in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.
Postal Orders.-To Advertisers, Subscribers, and Others.-It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. Stratton, as, unless the number of a Postal Order is known, and it has been made payable at a purticular office, and to a particular person, it is imposible to prevent any person into whose hands it may fall from negotiating it.
N.B.-The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.
Advertisements for the current week mUST reach the Office by first post, Thursday morning.
all Advertisements shouid be adareased to tho PUBLISEER.
Publiahting omice and owce for Advertinementr. 41, Whelington Strser, Sthand, W.C.

THERE IS NOTHING NEW UNDER THE SUN," is a saying credited to a variety of illustrious authors, from the time of Solomon to the preean eday. It it
fact that many inventions looked upon as modern are of ancient origin. The telephone, which recently caused such a furore of excitement, was in ancient days a means by which the high priests worked upon the credulity of their disciples. Tho Pyramids of Egypt and other wondere prove that this generation has a great deal to learn. HOLLOWAY'S PILLS and OINTMRNT, howevar, were not anticipated by our forefathers, and to-day they tand alone as the best cure the world poes. sesses for all the ills that humanity is heir ta.

\section*{PRIMOLA SINENSIS FIMBRIATA} MAGNUM BONUM.'

\section*{(Sterling Novelty for 1896).}

This beautiful variety will form an excellent com panion to the Giant White Primula, "Snowball," we sent out last year. It was raised by Messrs. J. \& J, Hayes, Edmonton. We have every confidence in placing it before our Customers, feeling confident that it will become as popular as our Giant White variety. The plants are very sturdy and compact in habit; the flower stem is strong, and rises well above the strong, robust foliage. The blooms are produced in great profusion, of a gigantic size, beautifully fringed, and the colour is a very beautiful shade of a rich deep red.

\section*{Fer Packet, 8 ?}

From Mr. Vert, 3 he Gardens, Audley End:- "I
have grown your magnificent Primula, "Giant Snowball," which is cf sturdy growth, with fringed foliagt throwing flower-stems well above the foliage, and producing abucdance of large blooms of great substance, many of the blooms measure \(2 \frac{3}{2}\) inches in diameter."

\section*{ENGLISH GARDENING.}

MISS AMHERST is well known to all lovers of old gardening literature for her pablication in last year's Archeoologia of the fifteenth century treatise on gardening by "Mayster Ion, Gardener," and the careful way in which that interesting treatise was edited by her, showed that she was well capable of larger efforts in the literature of gardening. The handsome volume now before us bears ample testimony not only to her skill and perseveranoe, but to her power of massing together a very large amount of petty details into a book that is throughout very pleasant reading.* The foundation of the book was laid by some excellent papers "On the History of Gardening in England down to the reign of Elizabeth," by Mr. Peroy Newbery, whioh appeared in these pages in 1839 ; and on this foundation Niss Amherst has made a continuous history of English gardening, starting from the thirteenth century and reaohing down to our own day. It is almost a pity that she did not tell ns more of the earlier periods, even starting from the departure of the Romans, for though the accounts of gardening in the days between the sixth and thirteenth centaries are very meagre, there is yet enough to show that from the very first the English were a nation of gardeners; and there is a good reoord that in the eighth century, when the AngloSarons were using the Latinised names, of which Miss Amberst gives a list on p. 3, there was a far larger number of true native British names of plants, showing that the Englishmen of that date were suffioiently acquainted with plants to give them distinct names. But English gardening, as indeed must be the case in all nations, is largely interwoven with English history, and this Miss Amherst brings out very well ; her first sentence is, "The history of the gardens of England follows step by step the history of the people. In times of peace and plenty they increasod and flourished, and daring years of war and distarbance, they suffered." And so she shows what difficulties there were in the way of good gardening till the end of the fifteenth centary, when, in "the comparative peace which followed the termination of the Wars of the Roses . . . the gardens were no longer of necessity confined within the embattled oastle walls . . . and the custom came in of having gardens beyond it. With this additional space, there was more soope for play of fanoy, and before long several changes in design came in." From that time to our own the progress of gardening has been uninterrupted, and Mias Amherst takes us through the gardens of the

\footnotetext{
* A History of Gardening in Exgland. Hy the How. Alicin Amherat. London: Quaritch.
}
different periods; the Elizabethan gardens, which owed much of their beanty to the refugees from the Continent, who "brought with them nome of the foreign ideas about gardening, and thus helped to improve the condition of hortioulture"; through the stiff gardens of the seventeenth centary, which were so largely destroyed (but of which, there are, fortunately, so many good remains) by the so-oalled natural gardening, or landscape gardening, down to the "bedded-out" gardens of our own day, and their partial destruction leading to the wild gardens and rook-garden, whioh are now the fashion.
One great value of Mise Amherat's book ir, that the bas brought together into one volume an immense masa of information of which very little is new, but which wan scattered through many different publications. The labour that she has apent in finding out these different soarce of information mat have been very grear, but the result is excellent. She hav aearched old cartulariep, piperolls, surveys, and probably hundreds of books, more or less bearing on her sabject; but perhaps the most interesting extracta that ohe has given us are those from the different accounts of garden expenses at various timer, and in different part of the country, and the bill for fruit and other garden produce maplied to Royal and other great houses and ahe has shown that, from the firat, the gardener was an important personage in all great establishmentr, and that the body of gardeners of London were of anch atrongth that they could dety even the Lord Mayor of London, and could demand and obtain a charter of incorporation which was far more in accordance with their own demande than with the wisher of the Lord Mayor.
We muat pate by with merely a word of notice the chapter on monastic gardening, though it contain much of intereat, to way something of the chapter on the literature of Eoglish gardening. The literature on any art or acience must always be an index to the existing condition of the art or science, and it is so in Eoglish gardening literature to a very marked exient. Nothing shows better the atate in which gardening was at different times than the book which appeared from the aixteenth century downwards ; and, therefore, Mise Amherat has done well to give very full accounts of gardening literature, with a long list of the writers. The value of these chapter is that they are placed side by side with the accounte of the gardenf, and so far they have a distinct value; but here, toe, there is nothing new, and the doen not seem to be aware of the many aimilar lista given by other writery, as by Pritze), Miller, \&c.; nor doen the seem to be aware of Palteney's Progress of Botany in England, 1790, an excellent book, though now almost forgotten, which may be Miss Amberst's excuse for not mentioning it.

We had noted neveral other pointe on which we should have liked to have aaid more, bat apace forbids. We must, however, find room for a few points on which we do not altogether agree with Miss Amberat; and we note them, not for the purpose of fault-fiading, bat in the bopee of helping her in preparing for : second edition. She in so ladably particular in giving full reference for all her statementr, that we should like to know the authority for the atatement (p.23) that "rosery," in some old documente of Ely, is not a Rone garden, but "a bed of Reede and Raihes." It it ac, no doubt, in the French cartuliriew, being derived from roseay; but we thonld question its being so used in Eaglish cartalaries. We are eorry that she adopte (p. 137) the exploded fallacy that the Jerusalem Artichoke in mo called from the Italian giratolo, for which there is no authority whatever, and her own quotation about "Jerualem Peare" might have shown her the mistak ; and we think she is miataken in asying that 1722 asw" probsbly the lant serious attempt at Vine culture." There it full evidence that exceltent wine was made in large quantities of Claverton, in

Someratahire, and tithes on Grapes were taken later than 1722 at Cromball, where are atill very complete remain of the old vinejard. Bat leaving all these mall deficiencier, we gladly conclade with thanks to Mise Amherat for the very pleasant book the has given uf, and with congratalation to her for having brought her long labours to such a satiafactory conclasion. A word of praise also is due to the getting ap of the book; paper, print, binding, and illustration are all that

can be desired, and it closes with two good inderengood, that ir, an far an they go, bat the book itself is mo full, that a much fuller index would be very acceptable in a afcond edition.

\section*{New or Noteworthy Plants.}

\section*{LeLIA ANCEPS var. LINEATA, new var.}

Is Lord Rothechild's gardens at Tring Park, Tring (gr., Mr. E. Hill), the house filled with the now numerous and beantiful varieties of Leiia ancepp, both white and coloured, annually make a fine how, and are counted among the most usefal of winter-flowering Oichids. Among them is a remarkable variety, flowering for the firat time. The petala are of the sizg and rich rovecrimson
colour of an ordinary good L . anceps. The front lobe of the lip is of a glowing criman, and the sidelobes are veined and atriped with a similarly bright hue, but the chief distinguishing feature consista in the epals being white at the base, the outer half of each and the margins being rosecrimson, the white basal halve having some clearly-defined chocolate lines on them as though dsawn with a pes, constitating a very peculiar and diatinct feature. J. O'B.

\section*{Constantinople}

\section*{ANONA CHERIMOLIA.}

Allow me to highly recommend thin to the notice of your readers at being a frait-plant, well worth cultivation. I am aurprised that the plant does not meet with general approval in Eogland, for the exceedingly choice fruits are obtainable from December to about February-a time when other fruit is necenarily acarce. I myself have only one plant, planted out in a house with other semitropical fruit treep, and although the position is not of the best, I obtain every year about a dozen fruits eacb, the size of a Pear. By the ame post I am sending you a fruit and a photrgraph of the tree as it atands (figs. 121, 122). Next to this plant we have planted out Auona quamors, A. Cherimolia Loxensif, which have also fruited this year. Anona quamone is generally well known, but A. Cherimolis Loxensis is mach more rare, and the frit, according to Linden, mast be auperior to that of Anona Cherimolis, which it resemblen in shape and size, but it has the skin raised all over the surface so to form little minee. Joh. Dekkers, Gardener to His Excellency Aristakes Azarian, Buyukdere, Constantinople.

\section*{The Rosary.}

\section*{STOCKS.}

Taz opesation of badding is to pleavant and striking in ita renults, that even where exhibiting is not thought of, many amateurs practise it ; ladies eapecially are fond of it, and their deft and delicate handling maken them very auccenful operators. Of coure, no amateur can contend with the professional badder, who rattle them cff in leas than no time, and whose quicknes neeme to many almost incredible. These amateare, then, will have to determine what atocks they will use, and how they will use them.

The question of atock is one which hat alwaye exercised the mind of rosariant, and while one is adrocating one kind, and another a different mort, I fear that jadgment will have been formed in many casea without due consideration for the character of the soil for which they are required, or for the varieties of R see to be budded on them. Varioul kind have been from time to time recommended, but for all practical parposes account may be taken of only four. De la Grifferaie, Napoleon, Celine, and other kinds, have been from time to time recommended, and our late Japanese Polyantha has been highly spoken of for Tea Roses, bat I think that few amateura will try experimenta, and therefore I shall confine myself to the four kind most geverally used.

The Briar.-The Dag Briar, or wild Rose, of our hedge-rows and woodlands; the Ssedling Briar, tte Biar cutting, and lantly, the Manetti. The Djg Briar is used almont exclusively for atandards and half-atandards. The introduction of dwarf Roses has conaiderably altered the practice in this particular ; standard are very much gone out of fashion, and the Ruse amateur use them only for his Teas and Noisetter-he is atill firmly persuaded that in no other way can he get auch exhibition blooms an from half atandards, and therefore the "Briar man," of whom Dasn Hole so humorounly writes, is atill in requisition. All Briar atocks ahould by planted about this time; of course, as they are received there is very littlo

Abrou root, and beginner might wonder where the roots were to come from-but no little atrese is laid upon these that I know one friend, at any rate, who pares off all the fibrous roots which are on the atock when he receives it, for he does not believe that the roots which are on the stock when he gete it are of any value. It is nomewhat carious that, notwithtanding thene stocks are obtained from our own hedge-rows, they esaily auccumb to hard front, and daring the earlier part of this year I know that 70 per cent. in some cases were killed; and I recollect reeing some years ago a plendid piece in the neighbourhood of Paris, of nome 30,000 which had been budded the year before, and were grand plant. of all the best kinds, but every one of them perished. For thene reasons I think all beginners, and all new exhibitors, ought to avoid a standard Rose. It is
with care the hips of those varieties which he know to be most nsefal. The process for preparing the seed for sowing \&c. is somewhat tireame, and few amateurt would care to go in for auch large quantitien; and reedling plants which will be fit for budding can now be obtained at any of our narserier, and should be planted in rows, the plants being about 6 inches apart and so placed that the portion for budding should be covered during the winter, which covering may easily be removed when the time for that operation comes on.

Briar cuttings has been of late years much in use ; it has its advantages over seedling Briar -itis, indeed, suited for a different kind of soil. The seedling Briar sends down its roots, and is suitable for atiff soils -indeed, Mr. Prince eaya for all moils; but the Briar cutting apreads ont its roots, and is therefore more

Fig. 122.-anona cherimolia, in fruit at constantinoplp. (see p. 734.)
not a thing of beauty in itself, and for years past I bave not grown one. It is true I am not an exhibitor, but I fancy that I have from dwarfs had as good bloom as could well be denired. I may asy that where standards are used it must never be when the woil is light, as they are apt to throw out suckers a long way from the plant, and to cause a good deal of trouble.
The Seedling Briar.-Some yeara ago, Mr. Prince, of Ozford, brought forward the seedling Briar, which had been previously uned a good deal in France, especially for grafting in pots, but he need it ont of doorn for Tea Rosen, and it has unqueationably become to be the recognised atock for that beantiful class. It in not too vigorouv in growth, so that it doen not overpower the acion; it is not so early as the Manetti, and so consfquently better escapes frosts. It is a somewhat nifficult stock to bud as the stems are so mall, bat it is pretty are to take if properly managed. Mr. Prince is of opinion, I thinls, that all Dog Rone are not equally valuable, and so collect
anited for light aoile. Both of these atock do, I believe, equally well for the Teas and Noisettes, and no one I think now-8-days thinkt of uaing the Manetti for that purpose.

The Manetti.-I now come to consider the Manetti, the introdaction of which; by the late Mr. Riveri, of Sawbridgeworth, hat so largely contribated to the increase of Rowe culture in this country. Some fow yeark ago there was a great outcry againat it, all kind: of evil practices were ascribed to it, and it days were said to be numbered. This was in ituelf ridiculour, for it mute over bo borne in mind that the amatear champion of former days, anch as Mr. Baker of Exeter and Mr. Jowett of Hereford, grew all apon the Manetti, whilst some of the finent bloom of the present day are exhibited from the same tock. Mr. Rivers received this atock some fifty yeart ago from Signor Crivelli, of Comr, who recommended this as the bent atock for all Romen (in this he wat mistaken). It wat atated by him to have been raised from seed by Signor Manetti, of the

Botanic Gardens of Mouzs. That it hat been a great boon to nurserymen and to all growers of the hybrid perpataal clan there cannot be the slightest donbt it is too vigorous for Teas, and there has been mach heartbarninga in convequence of the attempt to bud them on it-in fact, it is too vigorous for many of them and the atock overpowers the acions. It has another disadvantage, too; if all the eyes are not carefully cat out below the bud, they are apt to atart into growth, and many and many a time have I been aaked to account for a \(R\) me not blooming, when on looking at it I have found that the Manetti had completely overpowered the bud, and the foliage being somewhat like that of the Rose, the grower badallowed it to develop itnelf, leaving him with a fine bush of the atock inatead of a Charle Lafebvre or Marie Baumann, which he looked for. Manetti plante may be now easily procured from a nuraeryman, but it is very easily propagated from cuttings. The should be prepared as follows: the cuttings ahould be about a foot long, and ahould be cleanly cut just below a bud, in a straight line; all the eyes should be carefully cat out except a couple at the top, the catting should be cut in a slanting direction just above a bud. Mr. River give the following directlone as to planting them, and I do not think that the directions of that Rose-wise Neator can be improved upon: "In planting, the section of a ridge has to be formed, the cutting placed againat it, and the earth dog ap to it and firmly pressed; when finished the row of cuttinge should atand in the centre of a ridge about 8 inches higb, and only one bud of the cutting above the surface. From being thut moulded up, no exhatution taker place daring the dry froat of winter and spring, and every cutting will grow; in Jaly or August of the following season they will be fit to bud. The ridge mat be levelled so at to expose the main stem of the cutting; and, in this, at about 3 or 4 inches from the bottom, the bad must be inserted. The atocks thould be budded as soon as posible after being uncovered, or the bark will become rigid and will not open freely." As I have already said. care should be taken about ahoots coming from the atock, for however carefally the eyes have been cut out, some will probably have excaped notice. Let me alto asy that care ahould be taken as to the varieties which are used: for all weat-growing bybrid perpetuale the Manetti abould be avoided. for thougb, as a rule, it is well adapted for that class, it is ide to attempt to grow some of them on it, nuch binds an Horace Vernet and Lonis Van Hontte, which are ahort-lived on all atocks, very soon succamb to the vigour of the Manetti ; and experience will perhap: teach the grower that there are some other sort which in his soil and situation will not succeed on it. In fact, this experience is a abjuct which greatly enters into the secret of accessful Rosegrowing, and it is perhap only after mome failure that wished-for reault can be obtained. Wild Rove.

\section*{THE PLANTS OF THE BIBLE.*}
\(W_{k}\) are frequently asked to recommend acme book on the plants of the Bible, and if the queationer is not a profesed botanist, we have nome difficulty in giving a satisfactory reply. Some are too cutly, come are too auperficial, most are written by authors whone botanical education has been reglected. Neither of these charges can be brought about the premont little volume. It may be had for a thilling. The information it contain is trnatworthy, the anthor is an accomplished botanist, and familiar with the Mediterranean flora. Professor Henslow has solved our difficultief, and we shall confidently recommend his little book to those weeking information. The interest of the subject never flaga, and owing to the coniguration of the country, the flora of the Holy Land, an of Egypt, is pretty much what it was in those far-off time with which the earlier ss well as the later chapters of the Bible are concerned. Looking at the mitter from a parely botanical point of view, we may point out the difficalty, nay, in aome caven,

\footnotetext{
* The Plants of the BiMle, by the Rov. Gearge Eleutow,
} M.A. (The Roligious Tract Society.)
the impoasibility of assigning to any particular word a specific interpretation. The names are often used in a broad generic sense, and although we are told that Solomon "apake of trees from the Cedar tree that in in Lebanov, even unto the hyssop that apringeth out of the wall," we are not told that he wrote of them, atill leas, that he formed a herbariam by mean of which we moderns could determine what the trees were of which he spake. In the verse quoted, there is of coarme no doabt as to what Codar that is intended. It is in Lebanon still ; but what was the hyssop? and what was "the thintle that was in Lebanon and sent to the Cedar that was in Lebanon"? The words in the last citation aro doubtless used in a metaphorical sense; but with reference to H yseop, some eighteen aromatic Labiatea and one Caper have been mentioned, as in the opinion of divers commentators representing what is tranalated Hynsop

In the present little treatiae, we have firat an introduction, and then, in succession, chapters on textile materials, herbe nsed for culinary or medicinal parposer, fragrant gams and perfames, fruit treep, timber trees, desert treer, and aquatic planta.
To show how miatakes may ariae, and be perpetuater, we may mention how Gerarde, following De L'Obel, figares pitchers of the North American Sarracenia as the leaves of the Frankincense tree! The mistake is the more interesting, an this is the firnt notice of the Sarracenia that existe. The whole story was given in our colnmnr, Jan. 7, 1893, p.'11, and formp, we venture to aly, one of the most carioun inatances of "jamping at conclution" that could be cited. The origin of the Sarracenia pitchers wat forgotted, their natare andetected, and \(n 0\), by mischance, they got taken for the leaves of the Frankincense tree. It is needlent to asy, Profeanor Henslow falls into no auch blander, but aimilar error in the determination of other Biblical planta might probably be cited. Gaido depicts the crown of thornt as composed of the atout apines of the Gledituchialike the Sarracenir, an American plant. Othert more reasonably, uggest the Paliarne, which is common in Palestine, or the dwarf Poteriam spisosum.
The "Willow" by the rivers of Babylon waa presumably not, at Professor Honalow eupponer, a Willow, but what we now know as Popalus euphratica. Salix babylonica is of Chinese or Japanese origin, and if the Weeping Willow exint now in the valley of the Eaphrater, it has probably been introduced. Boisaier does not mention it as a native of Menopotamia, but eaye that probably some other specien has been mistaken for it. But the ubjects for comment auggented by Mr. Henslow's book are far too numerous for us to dilate apon We have indicated the general nature of ite contente, and we cordially recommend all those intereated in the aubject-as who is not ?-to make themelven the possessors of this auggestive little book.

\section*{CHRISTMAS ROSES.}

Ir the hardy plant garden at this season of the year, we have no flowering plant of such beauty and worth an the Chriatman Rowe, producing regalarly, as it doel at this dull meason of the your, fine mases of flowert, of perfectiv hardy and enduring character. To the gardener and caltivator generally the plant need present no great difficulty, if only a few esmentiale receiveattention. When very near to large manufacturing centrer, they frequently suffer from the effect of amoke, and the plants lowe much of their foliage. Where this is the case, the flowers are aure not to bs satiafactory; bat when grown in pare country air, the planta attain a vigour and luxariance which is a plesaure to behold. In many parts of Gloucestershire they are anaally excellent, and equally so in many party of Chenhire. In one instance, in the firat-named county, in an ordinary market garden, I have seen an acre of more of them in fine clumpe; and around Buth one may see many good clumps in the cottage gardens. In private gardong, where they
can be given epecial treatment, very few plant indsed more fully repay it, or more quickly.

The woil ahould be of good depth, and fairly rich. In Middlesex, on a light soil, which in ummer frequently become dut-dry everal inches deep, the plants uffer a good deal, and in these inatancea shade is of conaiderable service. Where posaible, 2 feet, or even 3 feet, deep of good soil should be given them, an the deeper the rooting median, the leas will the plants saffer from excesnive drought. It is aurprising the depth to which their roots dencend when opportunity is given them, and the benefit they thus obtain is equally marked. Hellebores, and those of the niger section in particular, are impatient of frequent removal, and care should be taken to treat them well when tranaplanting is rendered necessary.
The beat time in the year for dividing and replanting them is in early autumn. Of course, to aplit up large planta at this time incurs a aacrifice of flowers, and for this reason only a limited namber thould be broken up at one time. If carefully done, however, one large apecimen may readily be broken into a dozen and often a acore of piecea. Those who do not care to break up plants in the autumn will find the next beat time to be when flowering in complete. It is a common practice at this aeason of the year to lift good flowering roote and pot them for decoration in the greenhouse and coneervatory All auch plants, when flowering is past, ahould be broken into smaller piecer, and replanted, and on no account let them be planted back in the old clamp, as when thia in done they invariably decline in vigour. Benide planting them in a variety of positions, it is a good plan, if cut flowers are largely in demand, to plant some in apecially-prepared beda, and in auch a way that the bloom may be protected at flowering time. If lights are placed over them, blossoms of greater purity result, and sometime increased length of atem also. A very fine effect may be produced by growing Christmas Roses in large pots, or even tubs, plunging them their full depth in the open ground during nummer, and aupplying them plentifully with water and liquid-manare throughout the growing season. In this way their handsome foliage would be for the mont part reo teined, and it would add greatly to the general effect. J.

\section*{THE FLORA OF BOURBON.*}

Da. Cordemoy's new book on the flora of this beautiful island fils a gap in botanical literature, and in one of the most intereating contribation to syatematic and geographical botany of recent years. Baker's Flora of Mauritius and Seychelles appeared nearly twenty years ago, and the botany of Madagascar is now fairly well known, although there is no connolidated deacriptive account of the 5000 , or thereabouts, species of plants, published and unpublished, known to inhabit that country.

Commerson botanised Boarbon about the middle of the laat century, and made very extenaive collections, supplemented by copious notes and drawings; but he died before he had completed his work for publication, and his planta have, to a great extent, like the fraits of many other Freach expeditions, lain undisturbed in the rich national herbariam at Paris. Aubert du Petit-Thouars went to Bourbon in 1795, and remained there three jears. After his retarn to Paris, he published several important worky on the botany of this and the neighbouring islands, including Madagaecar, notably hiv Histoir Particulière des Plantes Orchidées recucillies sur les trois Iles Australes de 6 Afrique: de Françe, de Bowrbon, et de Madagascar.
Gandichand, another French botaniat of eminence, visited the island in 1818, bat his collections were lost in the wreck of the Uravic, near the Falkland Lulands. He returned to the island in 1837, in the Bonits, and subnequently wrote the botany of the voyage. This is incomplete, yet it is one of the mont interenting of the earlier contributions to insular floras.

Flore de lifile de la Réunion [Bourboo], par E. Jacob de

Several other botaniat have vinited the island and many of the peculiar plant have been described and figured in varion pablications. For the first time an attempt has been made to give the world at complete an enumeration of the plants as the author could, under the circumstances in which he is placed. Unfortunately, Dr. Cordemog had to work an beat he could, on the pot, or not at all; consequently the very extenaive old collections in the herbaria of Earope could not be utilised, or only to a amall extent by friends at home comparing odd apecimens for him. He therefore does not pretend to completeness ; and aa the greater part of the original foreste have disappeared in Bourbon, just as they have done in Mauritius, it is probable that many apecie that formerly inhabited the islend, no longer exiat. Nevertheless, a comparatively rich flora is deacribed in the book ander notice.
Boarbon is about the ame size as Mauritias, from which it is now separated by about 100 milea of sea, though it seem: probable that they were joined at some remote period. The mountaine rise to an altitude of more than 9000 feet, or nearly three times the height of the highest summite in Maaritian, and the inland presents a great variety of climatal conditions. Rain is abandant during the nummer month-November to April, and the mean temperature at St. Denis, on the coast, during this season is about \(26^{\circ} .5\) ( \(80^{\circ}\) Fahr.), sometimen rising to \(32^{\circ}\left(90^{\circ}\right.\) Fahr.). In winter the mean is \(20^{\circ} 5\) ( \(69^{\circ}\) Fahr.), and at St. Benoit \(12^{\circ}\) ( \(54^{\circ}\) Fahr.) On the Plaine des Palmistes, at an altitude of 3000 to 3500 feet, the thermometer drops in mid-winter to about the freezing point, and very rarely \(6^{\circ}\) Cont. ( \(22^{\circ}\) Fahr.) below. At 7000 to 7500 feet ice is ametimes found as late as November.

Formerly nearly the whole inland was covered with forest from the seashore up to an altitude of about 6500 feet. Bat for half a century all the available land in the lower region has been cleared for cultivation, and the native vegetation in replaced, where not actually under caltivation, by foreign weed. At the present day the forest region com mencer at 600 to 2500 feet.
Mont of the prominent and uneful foreat trees are common to the Mauritius, as are all of the Palma. But what is more remarkable, few of them are found elsewhere, though many of the genera of the region extend to Madagactar. In fact, there are vpry few genera peculiar to either Bourbon or Marritius, bat several restricted to the two, indicating that thene islands are separated remuants of a formerly more extenaive area of land. On the other hand, peculiar apecies are very numerous in both islands. Dr. Cordemoy and his collaborators, for he has not worked out all the orders himeelf, deacribe upwards of 200 species of flowering plante al new, in a total of leas than 1000. More than seventy of these new apecies are Orchids, and the aathor expresses his conviction that many terrentrial apecien jet remain undiecovered, an they are, many of them, very amall and inconspicuous, and their period of vegetation is of very short duration. Iadeed, a it is, the namber of specien of Orchide enumerated is 172, or more than donble the number of any other order of flowering plante! The island is alco exceedingly rich in Ferns and Lycopoda, which number together about 220 upecies. It is true that the author takes a narrower view of apecies than he probably would do if he were dealing with the Ferns of the whole world; but even after deduoting 20 per cent. on this accoant, there remain nearly a third more than there are in the Fern-flora of New Zealand. Not only are the apecien numerous, but between thirty and forty genera are represented. Tree and Filmy Forns are present, though they do not abound to the extent they do in the far-away mouthern country.
Retarning to the Orchids, we find that epiphytal and terrentrial specienare bothsbundant, though the latter preponderate numerically as to apecies; yet, as they arelens conspicuousindividually, and many of themaro exceedingly amall and rare, they are lens evident than the former. Among epiphyten the genus Angracum utand first, numbering about thirty apecies, inclading
the showy A. superbam, A. ebarnenm, A. gladiifolium, A. fragrans, and A. palmiforme. To these Dr. Cordemoy adds the following Orchid an noteworthy for their ornamental character: 庪onia macroatachya, \(\not\). eroatris, \(\mathbb{E}\). brachyatachya, Phojua longibracteatas, Calanthe sylvatica, Corymbis corymbona, Cryptopus elatus, Ealophia scripta, Habenaria prealta, H. ventricoma, Satyrium accenu, Amphorchis diacolor, Saccolabium quamatum, and \(S\). atriatum. Cordemoy also mentions Amphorchis discolor and Arnottia mauritiana as remarkable for their highly carious dimorphic flowern, "like the flower of diatinct genera on the aame pike; " but he gives no description of them.
The intermediate and upper zonen of vegetation comprise apecien of Phillipia, dwarf ahrubby Ericacf \(\mathfrak{x}\), Hypericum, Phylica (very numerous in South Aírica), Psiadia, and shrubby pecies of Senecio, prominent among which is the endemic S. Ambavilla, Favjasia and Eriothrix are other characteriatic
over, and a "perfect terror to evil-doers," be they beasts or human being. Tce finit which we ahow (fig. 123), was sent us by Commendatore Hanbary, from his rich garden at La Mortola on the Riviera. Its general appearance is shown in the figare the colour and aurface resemble those of an Apricot. The juice is intensely acid, bat if the frait is allowed to become a little over-ripe, the flavoar lowem mach of it acidity, and develops an aroma which is delicious. Few people like to eat the fruit raw, bat the jam, writes Profensor Macowar, is firat-rate. A proportion if Kei-Apple with Tomato would, he Hayp, make a good jam.

Cocos austraits (?) - We are sorry to be obliged to put a query to this name, av we have received fruits from three different sources, each with different names, The first to send it was our venerated corrempondent, M. Charle Nandin, of Antibes. Then Mr. Hanbury kindly furnithed us with some; and lastly, Prof. Perzig, of Ganos, obligingly sapplied us with opeci-

Fig. 123.-abraia caffra,
A, B, frnit of the natural size ; C, section; D, vertical, and E, transverse section of seed, magnifed.
ahrubby Compoaitæ. Plants of an alpine character are entirely wanting. Cardamine africana is the only native Crucifer, and Stellaria villowa, the only member of the Caryophyllaces. There are, however, two endemic apecie of Ranunculas, high up on the mountains. Agauria aalicifolia is an ericaceous ahrub or mall tree common to Bourbon, Mauriting, Madagascar, and the mountains of Tropical Africa. Altogether it is an exceedingly interesting flors, W. Botting Hemsley.

\section*{NEW FRUIT AT CHRISTMAS.}

Nor Oranges, nor Applea, nor Grapen, form the object of our present note, bat a few less widelyknown fruit, which have come under our notice lately, and which would be well worth the trouble of growing here under glast. The first we ahall mention is the Kei-Apple. This being a popular name, it will occasion no aurprise to hear that it is ensentially, if not superficially, an anlike an Apple as any two fruite could be. It is, in fact, the berry-like fruit of Aberia caffra, a Bixaceous plant, native of Natal and Caffraria, and which is recommended by Profemor Macowan ae a good hedge plant. It is a aturdy, stocky, hort-jointed grower, an evergreen, and with thorn which grow to 6 inches lovg and
menm, telling of at the aame time that the Palm had fruited annually for some yeare past. Cocon australif, if that be really ite namp, extendr, any Baron Von Mueller, from Brazil to Urugaay and the La Plata States. It it one of the hardient of all Palme, hardier even than the Date Palm, withotanding unprotected a cold at which Oranges and Lemona are injared or dentroyed. It remsined perfectly unipjared at Antiben at a temperature of \(15^{\circ}\) (Naudin).

Cocon anstralis is a pinnate-leaved specier, "with elegantly recurved leaver, an may be neen from the figure in Count Kerchove' useful work, Les Palmiers, and with atrong apines on the leaf-ntalks, at are manifest in some specimens before us. The fraits arp, as will be ween from our illuturation (fig. 124, p. 739), of the aize of Hezel-nuts, globular, golden-yellow, with a pulp of a delicion fiavour, comparable to that of a fine Pine-apple, and auitable for prewerves, or even for making wine. In the centre is a spherical hard atonp, whicb, when cut acros, reveale three cavitier, each with a ning'e reed. Now, in Cocos unually two of the three carpele are supprened, and one only goes on to matarity.

Other names wo have heard applied to this Palm are C. campentris, C. erionpatha of Drade, and C. leicapatha of Barl ora. We hope hortly
to be in a ponition to atate which is the correct name. In the meantime, the plant may be recommended for planting in our ab-tropical colonif: and under glane in this country. The fruit would be very acceptable on the table of the conroisuear. We append Profenar Perzig'a note on this Palm:-"I read in a recent namber of the Gardene - \(8^{\prime}\) Chronic'e a short commanication made by you upon the ripe frnit of Coco auntralis, sent from Antibes and La Mortola. I think it in not the trae Cocos australis, but that it in Cocos leiospatho, Barb. Rodrigo, a very hardy Palm, which grows in the open air perfectly in Genos, and throughout the whole Riviera, and which resisted a cold of \(2^{\circ}\) Celnian, without any harm in pite of a very atrong northern wind. I thick it is one of our mont hardy Palms. We have in our Botanic Garden, and in the pablic gardens of Genoe, numerous specimens of thia fine Cocor, and we have had flowers and ripe fruit of it these five years."

Lastly, we may mention the Cberimolia (Awona Cherimolia), one of the so-called Castard apples, specimens of which have been ent to as from Conatantinople, see 5 g .121 . We may refer for detaile of cultivation to the letter of our correspondent at p. 734. The plant occure from Ecuador to Pern, according to Von Mueller, is hardy in the mildes: coast-regions of Spain, and alno in Chile, whilat in Jamaica it is caltivated up to 5,000 feet.

\section*{THE CULTIVATION OF LIQUO-RICE-ROOT IN THE UNITED STATES.}

Is connequence of the increating use of Liquorice in America in the preparation of chewing-tobacco, the prospect of the cultivation of the plant in America has occupied the attention of landowner in that country for mome time past. Under the title of "The Caltivation of Liquorice root in the United States," Mr. Henry N. Rittenhoure contribated a valuable article on the subjuct to a recent number of the American Journal of Pharmacy. So .mach valuable information is contained in this paper, that we offer no apology for giving the gist of it for the benefit of our readers. The author pointa ont that Liquorice-root (Glycirrhiza glabra) is cultivated, in the true rense of that word, in 10 few places in the world, and to so amall an exteat an an article of commerce, as to be hardly worth mentioning, one or two places in England, and a like number in France and Germany, embrace all the localities where actual cultivation is carried on, and the area of land under cultivation varies from a few rode to an acre or two, 5 acren being an exceptionally large field.

The large mount of Liquorice imported into America-indeed, the needs of the world in this article are moatly supplied by plants which grow wild without any caltivation whatever. Italy and Spain supply a amall percentage of the total amount, probsbly 5 to 8 per cent.; while Southern Ru*nia, along the line of the Trans-Caucatian Railway, supplies two-thirde of the remainder, and Asia Minor and Syria the other third. The average total amount per annam of all kinde imported into the United Staten in about \(80,000,000\) pound , and the conaumption is atill increasing.

The Liquorice plant growe over an area extending from the hore of the Mediterranean on the autb, to Siberia on the north, and from the weatern ahorem of Earope, to the plains of Pervia and farther Indla, and from low levele to 1,500 feet above the tea, showing the wide area of land, and the variety of soil and climate over wich the plant will grow vigorounly. It is hardy, and no tenacione of li'o, that it in almont imponible to eradicate when once it has eatablished itmelf.

An found in commerce, Liquorice-root in dried and prened in baler. When freshly dug, it contains on an average 50 to 60 per cent. of moistare. Thin mat first be dried out, which is done by exponare to the air, much as hay is made, requiring frequent turnings and handling to prevent as much as possible, heating, fermenting, and darkening during the drying as well at the wetting by rain or snow, which
may be frequent before the root in dry enough to press for ahipment. When nearly dry, and danger from damage from the presence of moisture is passed, it is piled up in large stacks antil ready to be pressed. Around these atack: are dug ditches for draining the ground, and after a heavy shower or prolonged period of rain or snow, these ditches will fill with a black water having a very atrong tante, and containing a high percentage of the extractive matter of the root; this, of cource, detract from it name, and is itself waste. When anfficiently dry it it preased in powerful hydraulic pressen worked by steam, oo as to redace the balk to a minimum and to bave freight. The balen are bound with iron straps, and nometimes covered with canvas.
Some of the roote an imported are so thick that they indicate a probable growth of, perhaps, twenty years. These very thick pieces are, however, usually rejected as being worthless for making extract, three or four years being the age at which roots are dag up in the plantations about Pontefract, where the beat Liquorice-root in grown; after this age it becomes too woody and fibrous to be of much value in making extract.

Of course, a very emall proportion of the Liquoriceroot of commerce is grown in this country, and in consequence of the expenses attending the digging, drying, caring, pressing, baling, freight, insurance, and other items connected with the produce of Asia Minor and Russia, attention has been directed to the posuibility of growing the plant in the Uaited States for the parpose of aupplying its own demand. The connumption of the extract in America is now so large and important, eapecially in the manufactare of chewing tobacco, that it is stated that in case of a European war, a blockade of the Black Sea at the Dardanelley, or the Mediterranean at Gibraltar, the world's aupply would be effectually blocked, and the large American industry of tobacco-manufacturing thrown into coninvion, as Liquorice hat become a more or leas important ingredient in mont brande of chewing tobacco, and the present generation of chewera has become accustomed to its use. New brands omitting this ingredient might be unaaleable.

Considering the great variety of soil and climate in the United States, as well as the cheapness of land and labour, together with the large tracte of land available which are comparatively easy of accene for the tranaportation of the produce, it is eatimated that the cultivation of Liquorice would form a proftable industry in America, and would, in time, pay better than either Sagar-cane, Sugar-Beets, Rice, or Ootton, although the industry would not be solarge or important as any of these.
Liquorice extract can be mede an well or better from fresh root than from the dry, and ia mo made in the countrie that furniah the root, but the daty on it of 5 cents per pound largely restrictn its importation, while the root is free.
It is auggented that by introducing the cultivation of Liquorice into America, the extract may be made on aimilar lines as those now edopted in the manufacture of augar from cane and Beets, that in, to have large tracte of land devoted exclusively to the growth of the plant, with the factory for making the extract from the fresh root in or near the fields. The present sugar-fnctory, too, could easily be adapted to the manufacture of the Liquorice extract, the apparatus required being simply anitsble crushers or shredding machinery, the diffusion battery and vacuum pans for evaporating. Sagar factorien, too, could be atilived when not running on sugar, an the proper time for digging the root is from October to April, and if the root is not needed one year it can be left in the ground until the next, not only without deterioration, bat to ite increased value and woight. It is not well, however, to allow the root to exceed five years in growth; three or four-year root is the richeat in extractive matter, Fcost or drought do not injure the root when once wall eatabliahed, though young and tender planta are liable to injury.

After eelecting a euitable tract of land, the following if given at the beat mean of cultivation: "It ared only be ploughed once to farn down the
grass and weeds, barrowed, then laid out in farrown about 25 to 30 incbee apart, and the bude or catting net in the row: 6 or 8 inches apart, and covered by a plough throwing a farrow over the bude from each aide, or even cover them 3 or 4 inches with a hoe This is all. From time to time during the growing seavon a cultivator shoald be ran between the rowa to keep down weeds or grass. The tops at the end of the growing eason should be cat off; this could be done with a mowing machine. The second and third year the treatment would be the eame. In the fall of the third year the crop would be ready to harvest. The cost of the harvestigg would be the mont expensive part of the business." As the roots penetrate to a great depth, a good deal of labour ia required in digging them ap, bat it is auggented that this hand-work may be applanted by aome mechanical means of extracting them from the ground.
Mr. Rittenhouse points out that the idea of growing Liquorice in America ia not a naw one, and that in 1886 several acres were very accessfally growa near Sacramento, California, but that its growth way not peraevered in. He further asya:"My own experience in growing the plant in the United States has thus far been very moderate in results, owing to causes that might have been prevented, viz, inundations, unsuitable bads for planting, and possibly a want of care or interest or experience on the part of those in charge, to eay nothing of the effect of anusaally hot and dry weather on the young plants before they had become acclimatived. I have grown the plant in everal place in New Jeraey, Pennaylvania, Lovisiana, and Florida, and atill have some growing in the difforent localities, and believe it to be quite a feasible matter to introduce the industry on a large acte.
In connection wi h the cultivation of the Liquorice-plant, and the manufacture of Liquorice confectionery at Puatefract, the Chemist and Druggist atates that at a recent confectionera' dinner at the Holborn Reataurant, a town-coancillor of Pontefract, an representing the Liquorice manufacture, stated that the trade had conoiderably developed daring the past few yearn, and had it not been for this trade Pontefract would have been much lesp kaown, and in a much leas flourishing condition. Taousande of tons are manufactured annually, and diatributed at home and abroad. A large number of work-people are employed, and the money thas circulated contributes materially to the prosperity of the town. A distinct feature to which the trade owes its origin is the great depth of ail in the district, which makes it possible to grow Liquorice, this being the case in only one other part of the country, namely, Fusez.

\section*{MATTHEW ARNOLD AS A LOVER OF FLOWERS.}

Muce that in interesting has been written of late regarding the genius and characteriatics of this great poet, essagist, and critic, in connection with the recent publication of his lettere, which, how ever, do not give much insight into his life; but I have not dincovered in any of these reviewe a single reference to what I always deemed-enpecially after visiting him at his beautiful Sarrey renidence-his predomianting passiov, the love of gardening. There can be no queation, that Matthew Arnold was intensely fond of flowers. In one of the most valued of his many letters to myself, he saya of that exquisite vernal flower, which, rining as if from the grave of winter, seems ever to anticipateso early is its advent-the coming of apring: "I do not know that I have ever mentioned the Snowdrop in my veraee, but I have been planting it roand my whrabberies, and I admire it greatly." He had, however, in his classical poem entitled "Tristram and Iseult," aung of his heroine as a "Saowdrop by tho sen." I did not fail, subsequently, to remind him of this.

Is another of his letters, he anys of one of the mweetest and mons unobtrusive of flowers, with apecial reference to a poem I bad written upon the nabject, "Your poem on the Wood Sorrel hown
very considerable command of thought and exprension; but I could wish that you had aid more regarding ite apecial nelf, as I amparticularly fond of the flower."
Many incidental allunions to llower indigenons to Greece are diacoverable in his Merope, a work which, writen after the manner of Euripidep, has been highly eulogised by Algernon C. S wiaburne, a poet of whom Arnold has expressively said, with reference to the terribly diffase style of his contemporary, "Mr. S winburne writes a hanãred word where one would affice." The floral passages in this poem are chiefly found in the choraser, many of which are highly augentive of the senery of Greece. Bat Arnold's finest flowerinspirations occur in another and more-impressive poem, his deeply thoughtful and memorable "Thyrais," written to the memory of a beloved college friend, Arthur H. Clough. Therein, addrenning the too-early vanishing cuckoo, he sings:-

Too quick deapairer, wherefore wilt thou go? Soon will the high mideummer pomp come on; Soon will the Mask Carnations break and well;
Soun ahall we have gold-dusted Saapdragon,
Sweet William with his homely cottage mell, And Stock in fragrant blow;
Roses that down the alleye shine afar
And open, Janmine-muff \(\ni\) dattice:
And groups under the dreaming garden trees,
And the fall moon, and the white evening atar.
Matthew Arnold was, of course, an admirer of auch splendid flower as the Carnation, the Bagonia, the Lily, and the Rove; bat I have an idea that, like his great Teacher, the "High Prieat of Nature," be loved much more than these, the humbler beauties of the woods and fields. In "Thyrais" and the

S sholar Gipay," which may be regarded as hie most characteristic lyrical achievemente, the flowers which cling 10 fondly to his memory, as the alpine Linaria adheren to the wall, are the parple Fritillaries of the Oxfordshire meadow; the Orchises, the Daffodills, the poet's Narcissus; the Primrose gleaming by the hidden brooknide; and above all

Dark Blue-belle drenched with dew of nummer even.
The fair flowerete that gladden the vast aolitude of Nature, those that "die unseen, and wate their sweetness in the devert air," were dearent to his heart. Not of ambition were his songe begotten, whose happieat theme was love. He was himself a child of Natare, and he loved her meekest children best. And hence he could asy with his predecessor, William Wordaworth, to whom he was neareat of all his great contemporarien in nature and in life:-

Thank to that human heart by which we live,
Thanka to its tenderness, its joy, its feara;
To me the meaneat flower that blows can give,
Thoughts that do often lie too deep for tears." -David R. Williamson.

\section*{WINTER CUCUMBERS.}

Is order to maintain a regular aupply of Cucumbers daring the interval from the end of November to the end of March, it is neceasary that the cultivator should be provided with auitable accommodation in the way of a low-roofed light and air-tight house, supplied with top and bottom-heat, so that a minimum temperature of \(60^{\circ}\) to \(70^{\circ}\) can be maintained in all kinds of weather. To do this in very evere weather, it will be necensary and advinable to cover the glass at night with mats; indeed, this practice, on the ncore of economy, as well as a means of securing a more genial atmospheric temperature in the house, is to be commended during the wintor monthe.
The plante should receive careful attention in the matter of watering, an well as roist air, this last being regalated in accordance with the condition of the weather and the plants, bat a humid rather than an arid atmosphere should be maintained. Hence, daring mild weather, and conmequently alightly heated hot-water pipes, there will be no occaaion for aringing the planta, at doing so under the circumatances dencribed, would undoubtedly favour
the growth of mildew. On the other hand, should the nature of the weather be such as to necenitate severe firing to maintain the minimam temperature given above, a slight distribution of moisture in the house in the morning and afternoon, will be necesary to counteract the somewhat parching infuenca of the highly-heated piper, and to avoid infesting the plants with red-apider.
When water at the ronta is needed, it ahould have a temperature of about \(80^{\circ}\), and afforded in accordance with the requirements of each plant, bearing in mind that too much at one time cannot well make ap for a deficiency at another, hence the necemity of knowing when \({ }^{\text {Ito }}\) apply and when to withhold water at the roots, a knowledge only acquired by experience. If the Cacamber-hoasen are heated by their own boiler, the fires ahould be banked up by 830 or 9 o'clock on bright mornings, by which time sun will have rendered much artificial heat unnecessary. This should be done on bright molninga, even though the thermometer does not register the minimum degree of heat referred to above, for the obvious reanon that if the 'fires had been pushed on till a mid-day temperature'be attained, the sun, meanwhile, \({ }^{4}\) well as the fire-heat, would bave increased in force, thereby rendering almost immediate ventilation necesary, thas letting out the very thing (heat) upos which labour and fuel have been watted in gotting up in the house, and admitting cold.
The fires should be re-started in the afternoon, as soon as the ann goes off the house, so that by the time the nun-heat has fallen to \(65^{\circ}\), the heat from the hot-water pipes will anffice to maintain the proper degree of warmth during the night. In the event of severe front, a night temperature of \(60^{\circ}\) will be ample for the time being, but \(65^{\circ}\) ahould be the normal degree. To obtain and keep ap even this amount of warmth in a house of a moderate size, the supply of hot-water piping muat be liberal, and the fuel and atoking good. And with a view to accertain the degree of heat in the Cacumberbouse without letting in a volume of cold air whenever the door is opened forithat purpote, the thermometer should be placed in auch a position in the louse as to enable the degree of heat to be read by the gardener from without, with the asaiatance of his bull's-eye lantern at night. IThe above remarks are applicable to all forcing-hounes.
Should green or black aphis atteck the plante, famigate with one of Laff's fumigators a couple of eveninga in ancceanion when the weather is mild and the plants are damp. This fumigator has a shutdown lid, and two rowa of circular holes about half an inch in diameter immediately below it, for the emintion of the nicotine fumes. It is supported by three legz afficiently long to allow of the neceusary current of air for alow combution. Shoald mildew appear, duat the leaves affected with it with flowern-ot-sulphur when damp, and keep a drier atmonphere. The evaporating troughe on the flowpipen should be filled with liquid-manure water, maless mildew be present. Bat should red-spider entablish itself on the plantp, notwithatanding the application of the antidote, the piper should be painted with flowers-of-salphur when the plants and houre are dry in the evening, letting the temperature run up to abcut \(83^{\circ}\), so as to fill the hones with the aulpharous fume thrown off by the highly-heated pipes, airing the house more freely the two following dayp, or the plants may be aponged over (both vides of the individual leaves) with soft-soapy water. Crop the plant rather light than heavy, catting the fruit as soon as they have attained to proper \(\mathrm{s}^{\mathrm{i} z^{3}, \text { and }}\) atand them on their ends in aacers containing a little water in a fairly warm room ( \(55^{\circ}\) to \(60^{\circ}\) ). Keep all male blossoms picked off the plantr, as the necemary complement of fruit for a crop has been tecured, and encourage a free though consolidated growth in the plants. Lay a top-dressing of good fibrous loam to the thicknese of about 2 inches on
the roots the roots once between this date and February, the mould having been placed in the houte twents-four hours before being need, to become alightly warmed.
H. W. Ward.

Florist8' Flowers.

\section*{marguerite carnations.}

I read in the Gardeners' Chroniclo, at p. 645, "Marguerite Carnations were perfec", and it bas never fallen to my lot to see a finer show of bloom in all thades of colour." May I be allowed to remark apon two words uned in the above quotation -"perfec"," and "all"? Dealing with the laot one first, may I venture to ant if gellow and orange colours were represented? So far, I have not observed flowers of these tintr, nor, indeer, anything like so many beautifal shaden of colour as may be found in 2 bed of needlings of our own old-fashioned border Carnation, nor any flaker, bizarrer, or Picoteer. I fear the worda "all abades of colour" include too mact, as does the word "perfect," as applied to Marguerite Carnation. They are yet far from perfect-bat this does not detract from such merite as they posseas ; but thene merits are very mach obscared when the need is sown, so as to produce plants in bloom during the month of July or August, as at that reseon the finest Carnations are in fall beanty. In summer the blooma of the Marguerites are extremely fugaciour, and the flowera not being very doublc, pollen is plentifo', and fertilisation take place as acon as the blocms oper,

FIG. 121.-cocos AUSTRALIS. (SEE P. 737)
A, \(B\), fruit real size, orange-yellow; \(C\), vertical section, showing pulp, stone, and seed, with cavity in the centre;
D, E , stone. D, K, Btone.
causing them to fade the next day. Of course, if seed saving is the main olj \(\mathrm{c}^{s}\), that is attained. Tae beat time to mow Marguerite Carnation seed is, I consider, the latt week in March or the firat in Apri), and the plant if well managed will prodace a wealth of bloom in Ostober, November, and December. I have hundreds of the plants which have afforded cat blooms since early in the month of Oztober, and the plants look as if they would continue in bloom till March or April. I recommend them for the reason that their flowers are the very opposite of what the floriat terms perfect, being mostly fringed. To compare with thesp, there are seedlings raised at the same time of winter-flowering varietiep, viz, Uriah Pike (a good needgr), Mdlle. Carle, Miss Joliff, and others of that type of flower. It may be all a matter of tatip, but I prefer the seedling Tree Carnationr, and it is quite as easy to have these in flower if seed be sown at the ame time. My method of raising Carnations from seed is very nimple : the seed is nown in flower-pota or panf, which are plunged in bottom-heat of \(75^{\circ}\), and in less time than a week the seedlings appear. The seed pots or pans are then placed in a greenhouse near the glasp, or in a cold frame if the weather is not unfavourable. When large enough to handlp, the plante are pricked an inch apart into shallow boxer, and kept rather close in the cold frame until rooted into the fresh moald, and aboat the end of May, or early in the following montb, they may be
planted in large \(60^{\prime} r\), and into 32 's about the end of Jaly or early in August. The plants are kept ou'-of-doora all the time, and are freely ayringed and watered. It may be remarked that neither section will produce flowers at the same time, as quite half the namber of plants will not sho flower-bades so that the probabilities are this late lot will contion \(\rightarrow\) to flower until May and Jane. When in flower, the plants should be afforded a dry air, and a temperatare of about \(50^{\circ}\) at nigh', the ventilatore bein? opened daily for several hourt. Should aphide. apppar, fumigate the plants with tobacce. J. Douglas.
[A fairly rich vandy loam naita the Carnation at all eanons ; and when making its growth, an occasional pinch of salt atrewn on the soil will aid the \(m\) greatly. Never let the planta get drawn by any of the nasal canses, viz., crowding together with other plante. lack of light, or keeping them in the early atagea whilst under glase far from the roof of the pir, framer, or greenhoase. Afford good bat not excensive drainage ; pot firmly, bat never une a rammer, and always atand the poti on cosl-asher, or in some other way endeavour to keep worms out of the pots. Ed]

\section*{Forestry.}

\section*{PRICES OF BRITISH-GROWN TIMBER.}

Therr can be little doubt from carefully-compiled atatiatice obtained from almost every part of the country, that the value of home-grown timber hat rather decreased than otherwise during the pat twenty-five jears. This is enpecially the case with the Scotch and Spruce Firr, and markedly 00 with the Oat, the latter due in great meamare, no dout + , to the abatituting of iron for wood in ship and boat-building, and to other minor caasen which need not here be noted. Scotch Pine, owing in grect part to the amount of wind-fallen trees that has ever since the memorable "Tay-bridge gale" been placed on the market, har, perbapp, more than any other timber, decreased in valup, and plenty can now be obtained north of the Twoed at pricen varying from \(4 d\). to \(6 d\). per cabic foot. The large acreage of this Pine as well a: Sprace in the middle and northern Scottioh countier, acte too as a powerfal mfanm of leeping the price of the timber at the lowest ponsible ebr, aided of coarse by heavy railway or shipping ratee, and the amount that has been laid low by our cariously erratic atorms of the past few jears. Larch being mach in demand, and but little grown comparatively npeaking, is rather rising than falling off in price, and from 1s, to 1s. 4d. per foot is now frequently obtained for that of fair quality. The Larch diseasp, tor, has acted as a friend of the seller in sending ap the price of the timber, bat the comparative acarcity and many uses to which it is \(\mathrm{pa}^{+}\), are no doabt the greateat and chief causes why the timber either remain quiescent or rising in value. It is certainly to be regretted that more of the Larch in not planted, eapecially in Ireland, where the fell disesse in [at present] quite unknowr, and where thouands of acres of wate land, peculiarly snited for ite calture, could be profitably atilised in the growth of the tree. Good Oak timber now fetchen readily enough from \(1 \mathrm{~s}, 3 \mathrm{~d}\), to 2 s , per foot, and the demand is brisk; thougb, in years gone by, when the "wooden walle of old England" were maintainer, the price wat nearly three times what it is at present for the best trees. The caltivation of Oak, however, pays well enough at pretent, far better, indeed, than that of most other treen bar the Larcb, and it has never, and will not likely become a drag in the market. Sycamore, If large and good find. a ready market at very varying pricep, according to locality-from 2 s .6 d . down to 1 s 6 d , per foot. Is is a tree of rapid growth, wonderfally free from dieene, and by no means exacting as to the quality of soil in which it is planted. Even hedgerow and field specimens tarn out surprisingly good, and only a short time back we cut fully \(£ 200\) worth on a farm of 150 acree in extent. The largent tree contained 90 feet, and fetched \(28,6 d\). per foot.

Elm ir most difficalt timber to deal with, it varying oo in price, according to the part of the country where it is offered for sale. We sold a quantity, not apecially good, at fally 18 . per foot; bat in some paits of Kent and Sarrey, id. is nearer the melling price, and it is e ven difficalt to get rid of at that amount. Bat Ash, above almost every other tree, is the one for the apeculative planter to go in for in quantity, the ever-increasing demand clearly showing that we have not one tithe of the quantity that is annualiy required. The best fetchen quickly fally \(2^{2}\) per foot, and there is not a atock unsold from ons end of the land to the other, unless indeed, ander very pecaliar circamatancen.

We would atrongly urge on intending plantera the necessity for growing the Ash in quantity, and any dampiah loam aits it admirably.

Beech, if grown on chalky or gravelly soils, finds a ready market at from 10d. to 18. per foot, that off the Chilcern hilla and chalky reefe of Herta being quickly picked up, even at a trite over 13d, per foot.
"Maiden" Willow cannot be got for love or money, and the demand for cricket-bate will be are to increase with the Gruce memorial.

Birch, Alder, Poplar, and woode of a like kind wary a good deal in value, and around some of the Welah town for clog-tole making from \(8 d\), to 10 d . is seldom refused.
Mach of the home-grown timber is of very inferior quality, which fact tend directly to keep down pricen; bat, indeed, it can hardly be expected that the output of woode and plantations that are cultivated mainly for game rearing, whelter, and ornament can be either anfficiently clean or atraight to fetch anything like a remunerative price. \(A, D\). Webster.

\section*{Book Notice.}

\section*{Synoptical flora of North America.}

Osme great object of the late Asi Gray was the accomplishment of a complete Fiora of the Uaited Siates. Many years ago, in conjunction with Dr. Torrey, he pabliohed the beginning of such a lora. Five or aix editions of a Manual flora of the northern States also pased through the preas. In 1878 appeared a volume of the Synoptical Flora of North America; in 1884 another similar volume. The pablication of these instalments showed clearly that the tank was beyond the powers of one man, even thoagh that man was Ana Gray. The States themaelves multiplied, collectors became increasingly numerous, and their gatherings proportionately extensive and varied. And so it came to pass that the great and good man who is venerated in this country as be wan at home, died when only a fragment of his projected work was done. Now, three years after his death, comes another portion of the work (to be had of Wetley \& Son, 28, Eisex Street, Strand). It has been compiled from the notes left by Dr. Gray, and by his anccesaor, Dr. Sereno Watmon, aleo decessed, and their work has been continued by the present carator of the Gray Herbariam, Dr. Robinmon. Great featares of Dr. Gray were his excellont jadgment, the perfect clearness, and admirable imethod of hir deecriptive work. It redounde highly to the credit of Dr. Robinson that the present inatalment, which begina with the Rannnealaceas and ends with the Frankeniacex, presents the same admirable Incidity, tersenesf, and excellence of arrangement that characteriaed the portions produced by \(\mathrm{D}_{5}\). Gray. It in a source of antiofaction aloo to find that in mattere of nomenclature \(\mathrm{D}: \mathrm{R}\), bioson has followed the plan till lately adopted by almost all descriptive botaniats, and bas not been led away by the specious arguments of some of his countrymen, who regard nomenclature not merely at a convenient means to an end, but as in itself an end. With the Genera Plantarum the Index Kevensis, and now, the Symoptical Flora, we can but think that the mijurity of ayatematists will, in the intereste of selesca, continue to employ the most convenipnt zad the moat widely-accepted syatem confanion and unelent eynonymy.

\section*{WEST INDIES.}
partiality of cats to the avocado PEAR.
Ir may be interesting to place on record my experience in Grenada, so far as concerns the fondness cats have for the frait of the Avocado Pear (Persea gratimima). I was puzzled one day to know what to give two kittens which had jast previously been presented to me, when it was saggested by one of my men that a piece of Pear would be reliohed by them. This auggestion I accepted wilh snase amount of reservation, but it was not long before I sa maself that the Avocado Pear was eaten up by them as a dainty moreel. Since this occation, I have seen the ame two kitena, when milk and Pear have been placed before them at the wame time, to leave the former and eat the Pear voraciously. This incident appeared to me singular, and worthy of notice in your columns, as it had kitherto been my impression that cats were rather antegonistic to vegetarianism. It may not be generally known at home, that Avocado Pears are always eaten in a raw atate with bread-andbutter, or with other thinga according to taste W. E. Broadway, Botanic Garden, Grenada, B.W.I.

\section*{The Week's Work.}

\section*{THE ORCHID HOUREB.}

By W. H. White, Orehid Grower, Burford, Dorking.
DENDROBIUMB.-For flowering daring the late winter and early apring month, few Ochids are more aseful or appreciated than Dendrobiumu. At the present time, many apecies and varieties are showing their flower-buds, and some of them, viz, D. Wardianam, D. crastinode, D. micans \(\times\) D. Wardiano japonicum, and a few others are starting into growth, but that notwithatanding, the cultivator mast not be tempted to afford them mach water at the root, or antjuct them to a high temperatare, or the growths will grow too rapidly. and prevent the flower-bade coming to perfection. These premature growth generally remain almo stationary for a long time if the plants are kept moderately dry, cool, and in a well-ventilated house. When the flower-bude have reached fall development, take the plante, after gradually inuring them to the cbange, to a warmer house. D nobile, D. tortile, D. aureum, D. moniliforme, D. signatum, and the garden croses, \(D\) Casoiope X, D. Aopasia \(\times\), D. Barfordiense \(X, D\) Ainaworthii \(X, D\). Dominianum \(\times, \mathrm{D}\) splendidionmam \(\times, \mathrm{D}\). endocharis \(\times\) D. Schntiderisnum \(\times\) D. Lsechianam \(\times, D\) Cybele \(x, D\) Carysodiacue \(x\), \(D\). melanodiscas \(x\), D. Jano \(x\), \&e., not having the propensity to tart prematurely into growth when their fower-buda ahow, may be brought from the conl resting-house into a house somewhat warmer. The Catcleya or intermediate-house forms a saitable place for them till the flower-buds are well advanced, after which remove them to the lighteat available position in the East Indian-houne. From the present time, and till the flowers open, water should be very sparingly afforded at long intervals of time in anfficipnt quantity to keep the paendo-bulbs plump, and induce the slow advance of the buds. The species D crepidatum, D. cretaceum. D. primolinom, D. Boxalli, D. tranaparens. D. it ituiforum, D. Pıerardi, \&e., atill at reat, whould be \(k \in p t\) at reat till the flowerbuds show, when more warmth should be afforded them. D. chryanthum is a free-flowering handsome appecies, which as a basket-plant is much admirtd for its golden-yellow blossoms. As it is jast starting into growth, the rooting materis', if it has become in the least degreedecayed, atould ba picked out and replaced with fresh. It aucceede if bugg up near the roof in the Eut Indian-house; and tull the young roots have a firm hold of the compost, water ahould be very aparingly afforded, or the new growth may damp off. When the plant is in active growth, thoroughly water the comprat when it hat bucome dry. K+ep the plants of D. Johosoniz, D. speciossimam, D. taurinum, \(D\). nadalatom, \(D\) velutinum, \(D\). Amboinense, D. Hattoni, and others that are growing in the warmest honee, and water them liberally till the growth is quite matare.

CATTLEYAB.-Among those which flower late in the apriag and earily ammer, C. labiate Warneri is one of the handsomest, and any plants now starting to grow should b huog no, or flivated on inverted pots so at to be brought close to the roof at the warmer end of the Cattleya-honse, affording them water in anflicient quantity to fairly moisten the compost till growth is fully completed. Pisnts of C. Warneri newiy imported, on being received will need to be clesned, dead roots trimmed off, and then placed in pote which will jast hold the roots and no more, nearly filling up the pota with crocks, making the planta steady by tying two or three of the pseudo bulbe to sticks. Do not excite the piante into growth quickly, but place them in the intermediate houne, and surround them with a moist air, and moisten the crock two or three times a week. When growth has fairly begun, nome lumpe of peat and spbagnam-moss may be packed firmly around them in the usual manner, and let them be placed with the established specimens in the Cattlega-hoase, where, with the proper kind of treatment, they will soon become entablished, and sometimes make atronger growth in one searon than plants which have been in the collection for years.

\section*{THR KITCHEN GARDEN}

\section*{By Jobs Lambert Gardener, Powis Caatle, Welshpoob.}
horseradibh.--Preparations for planting a bed of Horeeradish may now be made, and if the demand is large and regular, a bed hould be planted every year. Horweradish is one of the most neglected of garden crops, being anaally left to take care of itsel! in ome out-of-the-way corser of the kitchen garden. A piece of ground should be welected sufficient to anpply the demand, and trenched \(2 \frac{1}{2}\) to 3 feet deep, if it will allow of this being done; a thick layer of rich manare being laid at tbe bottom of the trenches, and plenty of manure worked into the apper two spits, leaf-mould being freely used if the land be of a heavy nature. \(I_{5}\) is important that the bottom apit should be the richest, therefore the original top apit should always be placed at the bottom. The top upit may be left rougb. Crowns or nice young thongs about 3 or 4 inches make the best setp, and these shou'd be prepared when dug up from the bed in use. Fall instructions were given last apring on the best method of planting Horseradish.

Carrots and turnips.-Where early cropn of these roots are required, pits should be filled with fermenting materials similar to those suitable for Potato. The soil for the Carrote, however, should receive more attention than that used for the Potato, or the roots may be disfigured by invecta. A ligbt, sandy soll is to be preferred, mized with soor, lime, and charred parth. It ahould be pased through a \(\frac{1}{2}\)-inch screen or aieve to take out clods and atones. The aurface of the bed should come within 12 inches of the frame or pit-light when prested down and finithed off ready for the seed being nown. When it bas beccme warmed throughiout, sow the seeds in rows 9 inches apart. Good varieties for frame work are Parisiad. Frecch, and Satton's Inimitable Furcine, and Early Nanten Carroz. The Extra Early Milan Tarnip is a good vailiety for frame use, but it is no earlier than the old flat Datch.
radishes.-A pit or some framen with a aufficient number of lights should be prepared, as for Carrote, patting from 3 to 4 inches of soil on the hotbed materials. A pit of three lighta will keep up a succeasion of Radiohes for a long time, by anwing one third of the area at a time, and not letting the topa get crowded. Toe beat manner of nowing Radishes is to take three or four seeds between the fort finger and tbumb and prese them into the soil about a quaster of an inch, making the bed level with a plece of board or back of the rake, and patting it evenly all over with a bright apade. Ioproved French Breakfast is one of the bent for early work.

PARBLEY.-The mildnens of the westher has cansed Parsley to grow coasiderably of late, and it will bo very necessary to cover it ap on the approach of sharp frost-; also to pall off all of the outside 1 -aves of the plonte, a proceeding which will have the eff ct \(0^{\prime}\) giving more light to the young growth. Hoops and wate, or old lighta reating on bra-de, and other contrivancer, may be uned for protecting the plants. Even a mulching of fresh gathered-up Oak leavep, worked in among the foliage carefalig, asosate in sereening the plants from frost, besides sapporting the leaves ander fails of anow,
which would otherwise bresk the leaf-atalks down, and thus cause rotting. The Oak leaves can be kept in place by putting a small quantity of litter along the outside of the beds. The Paraley which is planted in pits and frames should alway be left to form a supply in hard weather.

\section*{FRUITS UNDER GLABS}
by Riceard Parker. Gardener, Goodwood, Chichestet
POT VINE8. - Vines that were started in a steady bottom-heat lat month should now be showing signa of growth, and a gradual increase of atmospieric heat must be afforded as this advinces. Train the canes to the trellis in their permanent position si moon as the bad have started to grow evenly. The young hoots grow very quickly, sud there is a danger of breaking them off if the operation be delayed. Small weakly growths which form at the base of the main shoots may be rabbed off at once. The main bads will also require to be reduced in number when growth is ufficiently advanced that those which are likely to produce the best bunchea may be selpeted. The bottr \(m\) heat should range from \(70^{\circ}\) to \(75^{\circ}\), and for this parpose a good heap of stable-litter and leaves mast be kppt in readiness to be packed round the pots as required. As the roots become additionally active each day, more frequent applications of water will ben+casary. Weak ॥quid-manure may be afforded, but it nhould always be used at a temperature several degres bigher than that of the house Continue to syringe the can at 9 Am and 2 Pm . on bright days; but if the weathur be dall and frosty, it is better to slikhtly dew them over o:ly once, at about 11 A.M Nu ventilation may be afforded, unless external condition are very favourable; and the heat in the hot-water pipes should be regulated carefully, to that the day tempara*ure may be about \(65^{\circ}\), Which may be increased to \(70^{\circ}\) as the san atriken the house. D) not over-heat the pipes at night, ge this practice tende th greatly weaken the growih; a temperature of \(60^{\circ}\) will quite suffice for the present.

Flas in Pors.-The earliest trees may now be housed, and growch hastened by planging the pots in a mild hot-bat, and farther treated
similarly to pot Viner. Springa the trees alighty once or twice a day, and do not afford a ereat deal of water at the roote. For the firat fortnight, the day cmperature hould not rise greatly above \(55^{\circ}\), bat loer that time and as growin proceedp, gradually acrease it.
PEACHE8. - Trees ia pots now coming into llower must be kept as near the glase as posaible. The trees may be syringed antil the first flower opent, but afterwards a drier atmosphere should be maintained. Sadden changes of temperature matt bo carefullv avoided, and a day temperature given of \(62^{\circ}\) to \(65^{\circ}\) daring mild wesiher, when air can be simitted with astery, and a \(f_{s i l}\) of \(2^{\circ}\) or \(3^{\circ}\) daring revere weathor. Tae night temperature may be lept about \(60^{\circ}\)

Fruit trees in pots which are till planged out-of-doors mat be carefally protected from birds, as these have already commenced on the forwardest buda of Caerries and Piames. Duat the trees over When wet with lime and soot, or protect the treen with Strawberry-nets.

\section*{TER YLOWRR GARDEN.}

By DAmey Wadns. Gardener, Birdsall Gardens, York.
PELARGONIUMB which are being wintered in pite and frames to which no fire-heat can be applied, may be atored away in pote or boxer, or even laid-in by the heple, and will require to be kept an dry as possible. Sorict attention muat be given to covering them up with dry materials in cave of severe and laid on hay or Forn way be pat next the glase and laid on thickly, then this bould be covered with farpanalin and well secared to keep all dry. Old plants of acarce varintip that bave been laid-in for vinery hould be potted off, and placed in an early inery or other wara bouse where they will com'rence to grow, and produce boots fit for cattinge. live atore cathngs in boxes or pote plenty of air. If will require jhelves in houses that can be heated, they and frequire jut sofficient water to keep the m plump "quires. Variogated and Iog-leaved Pelargonimas aquire less water curing the winter than \(z\) nal Siarburough Speet-scented varietin, enpecially Lady Mare, dry ar. require very carelul watering, and a
in if if they are pat on a slate or iron atagiop, it ahould bo covered with rough sand, that the water may get
easily away. Give abundance of air and a little fire-beat at times in mild weather. If green-fly appear, fumigate the plants at once.

FUCHSIAB. When cuttinga are required of eelect varities for bedding parposes, old plants which were lifted from flower beds in the autumn and atored away in sheds should be potted in good rich soil, well wateran, and placed in a warm house, anch as an early Prach-house or vinery. Thin out the weak hoote, and prane back tho remaining to three or four fyes. These will quickly give a good supply of cutting", which will atrike freely under bell-glasses in a gentle bottcm heat.

\section*{miscellaneous bedding plants.-Verbena,} Heliotroper, Gizaniap, Agathes co'eatir, Lobeliar, Nierembergia, and other bedding plante of the same clane, ry quire a cool airy house and careful watering. T-nder plants such as Coleap, Iresiner, and Alternantheras mast be kept in a warnoer temperature. If the atock rfquirea increanirg to a great extent, propagating may be commenced at once. Cattinga will atrike very freely in a warm, close hoase at this aeason. Mignonette and other annaals that are being wintered in pits and frames hould have abundance of air given them during fine weather, and they must not be over-watered, Calceclarias in frames require abardance of air daring mild weather, and it will be well to cover them up against sharp fronte. If it is thought necesarr, cutting may be put in at once, and may be taken from the tops of those that are growing freely. Tapy will atrike readily in a close and thaded frame, Sweet \(\mathrm{P}+\mathrm{a}\) zowings should now be made in 6 inch pote, to be planted ont at the end of Janaser should weather permit. A sowing was mada here in 12 -inch pot in October; they have been kept in a cool house, and are looking atrong and well. Dabliap, Cannup, Begoniap, Gladioli, and other flower-root which are stored away in shed will need to be pritucid from fros', and they must not be allowed to become over-damp; sofar, this has been a season of andden changer, from heat to cold, but on the whole favoarable for outdoor garden operatione. Every advantage should be takan of fine days to pash on with the planting and re-arranging of all kindr, bearing in mind the weather we had to contend agninat duriag the emrly moathe of the present year.

\section*{PLANTS UNDER GLAS8.}

By W. H. Smite, Gardener, West Dean Park, Chichenter.
the gardenia - Plante required to flower in quantity early in the new year ahould bave the old material in which they are planged removed and renovated with thia jear' Oak or Beech leaver. A top-dresaing of rich loamy aill, ard a slight dressing of an approved artificial manure hould be applied. Tue honse or pit in which the plant will atand should be made clean, also the plants, paying great attention to the deatruction of maly bug and brown scalp, two very noxions pets infeating Gardenias. The best mpans to use againet them is petroleum, in the propostion of one wine-glass'al to three gallons of a oapads, at a temperature of \(95^{\circ}\). If the Gardenisa are syringed once a month with this mixture it will clean the leaves and free the plants from mealy-bug and brown acale. Of course, during the flowering sesson this could not be dove. A gocd method of having Gardenia blooms at every eseon is to plant them out in a pit or house where there are ample mean of beating, and the plants ahould not be praved, except just to thin the ehoots when crowded. At this season they woald require plenty of heat, abundance of water at the roots, and syringing twice daily.

WINTER FLOWERING CARNATIONS.-Cattinge to sapply plant to flower early next winter may now be struck in the stove or propagating-pit. Take strong, ahort shoots, and insert seven or eight in a 3 -inch flower-pot, in a compost of asdy loam and peat. Much care must be exercised while in process of atriking, to prevent the damping-cff of the cuttings; but this can uacally be averted by wiping the glase dry on the handlights or cooche night and morning. A few new varipips worth eultivating are Madnme E. Bergmar, Mrr. Finet, La Villettp, Laday, and Primrose Day; the latter has a dwarf habit, respmbling Winter Cheer, and jellow flowern. Yellow-flowered varietien of winter-flowering Carnation are acarce, and this is a very acceptable movelty.
bouvardas, se fast as the plante go ont of flower, abould be placed in a cooler house, and be
afforded lens water at the root. A warm frame would ait them, as they could be enabled to obtain abandant light and air to mature their growth before water is entirely withheld.

CYCLAMENB.-Forward plant now flowering freely should beafforded weak manure-water, anch as Clay'p, making an occaoional change with a weak mixture of soot in rain-water. When the plants are at their beat, the air of the house mav be kept a little drier and cooler, say \(53^{\circ}\) by day, to \(50^{\circ}\) by night, with artiscial heat, and a trifing amount of top and bottom ventilation at all timep, excepting in very evere weather. The fumigation of the plants is desirable once a month as a preventive of attack of green or black aphis ańd thripe. Some needlivga may now be ready for potting-off into thambe. As a potting-mould, use finely-sifted loam, peat, leafmould, and and; pot them with moderate fi!mness: place on a ahelf near the roof, and lightly asringe them twice daily. A'ter poting, afford a light watering to settle the ail about the roots. Examire the plant for aphis, and use a soft brush to dialodga them when foond. Those seedlings which are too small to be potted-off, may be pricked-off into other pans to grow atronger; they will form a saccension to the earlier-potted oner. I naually find that the last seede of Cyclamen to germinate bring the beat fowers.

\section*{THE HARDY FRUIT GARDTN}

By W. Pope. Gardener, Highelere Castls, Newbury.
the treatment of old fruit trees.-If any aged fruit treea are fit to be retained for nome years longer, it will be well that something should be done to improve the fruit and the quantity of it. With this intent, top-dressinge of well-decayed vegetable refusp, which bas been turned once or twice, and quicslime added to it at auch timer, wood-asher, and especially charred garden rabbish. These top-drasings abould be applemented by copious applications of liquid-mavare from the farmyard or atable, which, now that the trees are at reat, may be used without dilation. The good effecte of these dressings will be increased vigour, clean growth, and improvement in the quality of the frait. In the care of rank-growing barren trefs. exceptions must of courae be made, and instead of affording nutriment, root-pruning ahould be resorted to, whict is best done early in the antumn, bat it may be done at any time daring the winter in open weather, R not-praning mat be cautionsly carried out, and halfway round and under a tree will be sufficient for one year. Begin by opening a trench 4 feet from the stem, and aever the strong tap and main deacending rootr, bat preserving all that are near to the aurface. A few wheelbarrow loads of fresh materials will be of great use, placed round the roots in encouraging the growth of omall feeding-roots. It in often the cane that partial root-pruning has the fffect of checking rampant growth and indacing fraitfulsess, bat if it have not the desired effect the remaining portion should be root-pruned the next season. Tree of inferior kinde, if healthy, thould be headed back preparatory to grasting them with scions of better varitties, for which purpose the latter may be taken now and laid in nader a north wall. or in some damp cool place. Old Peach and Nectarine treen with cankered branches, of which are unhealthy, will be greatly improved by being cut back to within a foot or so of the stem, carelully hortening the roote, and layivg them in maiden losm. The asual reanlt of thi lind of treatment is to refurnish the trees with abundance of healthy, fruitul wood, often superior to that of newly-planted young trees. Od Pear and Plum trees on walls crowded with clutera of long apurs, and bearing, perhape, only \({ }^{(1)}\) few, worthless fraits, should have the spare freely thinned here and there all over the trees, and about one-third be cut back to within an inch or so of the branches. A strong ahoot or two will generally apring from the base of each, which, with proper attention paid to atopping once or twice during growib, will develod into new frait-spars lying close to the branches. In three or four years, by that annually taking out ecme of the remaining apars, the full benefit of the wall as a shelter for the tlossom will bo secared, with a correaponding improvement in the fruit in regard to quantity and quality.

The Glabtonbuay Thorn is in full flower and leaf in the Botanic Garden of Trinity College, Dablin.

\section*{EDITORIAL NOTICES.}

Advertisaments should be ment to the PUBLISHER
Local News.-Correspondents will greally oblige by sending to the Editor early intelligence of local events likely to be of interest to our readers, or of any matters wohich it is desirable to bring under the notice of horticulturists.
Illustrations.-The Editor will thanksully receive and select photographe or drawings, suitable for reproduction in these pages, of gardens, or of remarkable planks, towers, brees, ac.; but he cannot be responsible for loss or infury.
Letters for Publication. - AIt communications intended for publication, as well as specimens and plants for naming, should be addressed to the Editor, 41, Wellington Street, Covent Garden, London. Communications should be WRITTEN ON ONE BIDE ONLT OF THE PAPER, sent as early in the week as possible, and duly signed by the writer. If desired, the signature will not be printed, but the writer. If a guarantee of good faith. The Editor does not undertopk to a gay for any contributions, or to return unused comtake to pay for any contributions, or to return unused com-
appointments for the ensuing week.

\section*{SALE.}

DEC. 23 \{ Plants, Roses, Hardy Bulbe \&c at Protheroe Morris' Booms.
vORRECTED AVERAGE TEMPERATURE FOR TGE ENSUing Week, deduced from the objervations OF FORTY-THREE YEARS, AT CHISWICK. \(-384^{\circ}\)

Christmastide. As our tastes and interests are from whioh we individually view the Christmas season. With all its inconveniences, the season is by no means an enemy to commeroe. Daring its observance trade is hopelessly disorganised, but the extraordinary impetus every branch experiences in preparation for the festivities more than compensate for this. At Christmas we all seem to gain, and all to lose. If we receive more than usual, we also spend more, and the manifestation of spending power is greater than ocours at any other part of the year. So far, therefore, as we can see, the observance of this festival is not likely to be diminished, though naturally the methods by which it is celebrated will alter slightly with every decade. The noisy, riotous scenes and indulgences that were once characteristic of the season, do not now obtain in the same degree, and we have reason to be thankful that the case is so, and that the money once expended in such a manner is now free to purchase more rational comforts, and time oan be given to the pursuit of more reasonable methods of enjoyment.

Looking at Christmas from our own partioular standpoint, we find that the resouroes of hortioulture are more and more freely drawn upon. Every class of the publio spends more of its money upon plants and flowers. The ancient custom of associating the Misleto, the Holly, and other berried plants with Christmas, for many long years has been encouraged by the abseuce of any other natural material wherewith to decorate our homes or our charohes. Of evergreens even, there was not the variety at the commencement of the century that we have now, owing to the introduction to this cuantry of species and varieties of Conifers, peouliarly suitable for Christmas trees, \&e. As long as the seaton has any charm for us, we are not likely to despise the Misleto, Holly, and Ivy, which for centuries have been associated with its observance. Indeed, kerried plants of all descriptions appeal to us in December with quite irreaistible fascination. We continue to weloome these, but our sympathies are not the less able to embrace the abundance of flowers that modern hortioalture has made possible to us. The former are now largely supplemented in our decorations by a variety of planta and flowers that
we, by reason of our hot-honses, are enabled to enjoy at a time when formerly they were not procurable. When we think of what has been accomplished, of the advantages we possess that our forefathers knew nothing of, though we see little to boast of, there is plenty to interest-and even to astonish us !

Half a century ago the amount of "glass" in our gardens was small, only the largest of them possessed facilities for the growth and production of exotic plants and flowers, and the foroing of these in December was but little practised, and as little understood. The str des made since then have been rapid and long, the increased facilities for the production of flowers has encouraged the desire for them, and the demand and supply have both inoreased at a prodigious rate. It is little exaggeration to say that now we cover half our gardens with glass, and we gather some of the choioest of our flowers at Christmastide.

\section*{Christmas Plants.}

Of flowering plante now obtair, in December, in succession to Chrysanthemum", four of the beat-known in the market, io., Heaths, Solanume, Primulay, and Cyclamens. Tae Heathe, once grown by nursergmen, auch as Messrs. Hugh Low \& Co., of Clapton, and Mesars. Catbanh \& Sons, Highgate, for distribation to gardeners only, have, for a number of years past, been taken in hand by the market growers, and they have treated many of them with remarkable nuccesp, placing them apon the market at popular prices and in quantity, imilar to the fancy Pelargoniums. None of the Heaths, however, can be asid to be exactly Christmas plants; Erica gracilis (the red Heatb) is now almost past, being frequently in bloom in Ostober; \(\mathbf{E}\) hyemalis and E h. alba may be seen in the market, but not in great quantity, nor have we seen many p'ants of it in lower when viaiting some of the market narverie daring the past week. What are now to be bought have been specially kept back for this week'sale, E. Wilmoreana, a larger and more ahowy plant than E. hyemalis, cannot be had soon enougb, but comen in nicely during the earlier months of the year.

Mr. Sweet, of Finchley, is known ay one of the bett Heath growers for market, and his plants are picture of succeasful culture, compact, shapely, and covered with abandance of bloom. Mearr. J. \& J. Hayes, Edmonton, Mr. J. Fraaer, Mesars. Gregory \& Evan, Sidcap, Mr. Ladde, Swanley, Mr. E. R chford, and others, have grown them largely alao. We recently noticed at Mesarr. Hagh Low \& Co.'s nuraery a quantity of E. melanthera, which had been forced into flower, the bloom being white, inatead of the light purple they anaally are when produced in apring. It is not of much service, however, for such early forcing, and the plant is lene popalar in apring than it used to bp, though Mr. Sweet hat been selling plante of E. melanthera with better-coloured flowern. Mont of the varieties are pretty and effective plants to put into vases, and obtained through the market they are very cheap, but they are little underatood by many who bay them, and they may be frequently seen in rentaurants, hotels, and house-windows, with the pointe of their shoote hanging hopelensly down, languishing for water.

Solanum capsicastrum is essentially a winter plant, and many-almost all-market-growern cultivate them but we have never seen any so fine as those grown by Mearr. J. \& J. Hayer, Edmonton. Their plante are remarkable for the small sizs of the foliage, and the extra large nize of the berrien. They grow them in thousands, and were amongat the firnt to caltivate a large nuaber annually from cuttinge. Mr. E. Rochford, Cheshant, raines about 10000 plants annually. Solaumes ell more readily than other plante during the prement week and part of next; but, aE eeveral growers have remarked to the writer, "Come Boxing-day, and buyern won'c look at them."
Primulat are pretty and usefal for warm rooms, bat are too delicate to be placed in dranghts or cold
placen at this aemon. They have long been market planta; bat we are inclined to think the trade in them is less than formerly. Mears. Williama and others are elling very well-growa and pretty planta in several colours.

Cyclamen.-A more popalar and a hardier plant is the Cyclamen, especially an the foliage is less liable to injary. There are more annually forced into bloom daring the present month than was ever the casp, and unually the sale is eaty. At Mr. Whiteley'p, Hillingdor, there was recently a wonderfully large dieplay of pare white ones; and the St. George's Nurnery C)., Hanwell, grow many thousand for market. We noticed some of a vary good atrain at Mensrs. Low'r, bat of course these are not put apon the market, being all sold to private customere. By the way, if we do not have an opportunity of seoing Gorman Cgclamens in the meantime, there will be plenty in Eagland next year, for we have reason to know that aince the letter from Berlin on the abject appeared in thene pager, one firm at least hay possessed itself of a good quantity of seed from first-rate Garman collections. At to whether the bloome will be so much better than auch a atrain as Mesars. Sutton's or Mennry. Williams', our German friend will excuse us being a little aceptical.
Besides these plante, there are Richardiay, Poinsettia red and whitp, white Marguerite about 14 inchen high, in 5 inch pote, and literally covered with blossomr, and Mignonsttp. In addition, there is the anaal large and varied aupply of well-grown foliage plantr, Palm", Fernp, Diacænay, Asparagas, Smilax (Myraiphyllam), \&c.
The new race of Cannas will make a valuable and diatinct addition to the flowering planta that may be had in bloom daring the present montb. Mearr. H. Cannell \& S one ancceed in obtaining flowers throughout the year, and are able to exhibit them in fair quantity at the present date. Of course, they are unanitable for market work, but a group of them In flower at this season in our conservatories would be the mont lovaly and atriking addition to zonal Pelargoniume and the like, than we have had for yeare.

\section*{Cut Flowers.}

Of cut flower there is much greater variety, than one cees in the planta; indeed, we need not lack these, for the market is well supplied. For the purpose of preparing this note, we attended one of the early morning wholesale markets at Covent Garder, and the impression the visit gave it that the last days in the year are now certainly not flowarless ones. \(\mathrm{Ye}^{*}\), in some instances, at least, the aupply in this particular year is not exceptional. For instance, a viait to the large entablishment of Mr. George May's, at Upper Teddingtod, showed that he hat practically no Eucharis blooms to cat. Hare is the largest and beat collection of Eacharia planta we have ever seen, and during the ame week late year, Mr. May was marketing acore of dozen of blooms each day. He will have plenty later though, and they promise to be of excellent quality. Abundance of Bonvardia blooms may be aeen in the market. The plants are grown maoh more largely for the apply of cut bloom than to eell as plants; and R ses alco are plentiful. Mr. May hat a good aupply of the latter. That a variety of cut bloom is at hand is proved by the following list, moat of which are in the market in considerable quantity -Chrysanthemums of late sorts, wuch as L. Canning, Princens Blanche, Princent Vichoris, and W. H. Lincoln, a variety which can be had early or late; Lilium lancifolium, L. longifloram, and L. I. Harrisi ; Roses, Carnations, Eacharis, Cyclamens, Lapagerias, double Primulaz, Azaleas, enpecially the capital white one, Deuteche Perle; Richardiar, Camellias, Taberones, Gardeniar, Pancratiams, Freenias, Roman Hyacinths. Talipm, Lilies of the Valley, yollow and white Narcisury, and Violets. The Narclesu is imported from France, so aleo are numbern of Violets, the former may be forced into flower here by thie date, but they come very much less kindly. In addition to these, a good aupply of Rose bude,

Staphylea colchica, white-flowered Lilac, and yellow Marguerites, may be had from the foreign flower atalla, and a very amall quantity of Acacia sprays. There were some excellent Christmas Rosen (Helleborus niger) at last Tuesday's early market, bat lean in quantity than one would expect.
A few days since we arw at Mr. Iceton'e nurbery at Patney Park Lane, an aatoniahing quantity of Lily of the Valley, ready for cutting. This bloom is the product of new crowns or bud, not retarded onen, and they were very fine, many of the apikes having fifteen good-sized belle upon them. Do what the grower will, however, it is impossible to get much foliage from theme early-forced bada, and relatively to this, a batch of retarded bude are useful. The flowers are lean freah-looking, and of weaker quality, but there is plenty of foliage, and this has to be used aparingly when marketing the finer hloom: from the new bude. The retarding
varietien were Chrywolora, Yellow Prince, White Pottebakker, and red Dac Van Thol.
From the above will be seen there is ample material for the making of bouquete, batton-holep, and the furnishing of ball-rooms. We have not mentioned Orchidp, because there are few old in the wholesale market, and they are always acarce at Christmas; Cypripedium innigne, thougb, may be had in tome quantity.

The difference in quantity of the flowers and plants now available at this aeason, compared witb, say, thirty years age, is not greater than the difference in the prices they realise ; some of them sell now for less than one-third of what was given for them then. The public is the gainer, and apparently the growere, by dealing with a large quantitf, manage to make them pay well. One of them remarked to u, anent thir, that "The growers grambled then, they only do that now! " \(P\).
alpines, \&c., will be held from May 1 to October 15 Temporary exhibition will also be held from May 1 to 15, Jane 10 to 15, Jaly 15 to 20. Aagust 15 to 25, and September 22 until Oatober 15.

Our Almanack.-Secretarien of Horticultaral Societies and others, are earnestly requested to forward immediately, the dates of Show Fixtures and of Meetinge of Botanical and Horticultaral Societien of any kind for 1896, for intertion in the Almanack, to be pablished in our inane for January 4.

Gardenerb' Royal Benevolent ingtitution, Concerts at Altrincham.-The membere of the Altrincham and Diotrict Gardenera' Improvement Society have alwaya taken a deep interent in the welfare of the Gurdenere' Royal Benevolent Inatitution and of the Royal Gardeneri' Orphan Fuad, and the efforts made on behalf of thene denerving

Fig. 125.-mitonia fexillabit, in majos joicet's garden, sumningdale pabe.
syatem by mean of a refrigerstor has been practined for many gears, and with other plants beside Lilies of the Valley, though the method was inaptly described by the Times lat week as a totally new departure in horticulture. Ais matter of fact, it is fifteen to twenty yearm sincs Mr. Iceton, and Mr. dannock of Dersingham, both of whom were living then at Barnes, together made experimente in this matter, and the syatem has proved to be useful one by which to obtain flowers in late autamn. It is only now at the end of December that the produce from crowns ao treated can be beaten by early forcing. At Tuendas' market there was aome bloom of Astilbe (Spirsa) juponica on the atand belonging to Mr . Thow. Rochford, of Broxboarne, which we were informed was from laat year's clumpa so treated. The reaerve was nearly exhauated however.

In addition to the Lilies at Mr. Iceton's were good enpplies of \(\mathbf{R}\) (man Hyacinths and Talips. The last named take bedly to auch hard forcing, and alway at this date have the appearance that they have been roused from their natural rest cruelly soon. The

Miltonia vexillaria.-Oar illustration above, fir. 125 , represents an unusually fine specimen of a large-flowered type of the opeciez, at it appeared this year in Major Joicsy's gardev, Sunningảale Part. The plant was then growing in an 8 inch flower-pot, and carried thirts-aine flower-apiker, ench of which bore on on average eeven bloomp. We think, and our readers will doubtlen agres with w , that no fiaer apecimen of this beantiful apecies has been seen under cultivation, and that it reflecta much credit on Mr. F. J. Thonne, the gardener at Suaningdale Park.

GHENT.-A great Chryaanthemum exhibition will be held at Ghent, under the anspices of the Ryyal Society of Agricultare and Botsnr, from November 15 to 17, 1896.

National Swige Exhibition, 1896.-In connection with the exhibition to be held in Geneva next year, we are informed by Mr. Marc Mrcerli that permanent exbibition of trees, perenniald,
institutions have been aupported in generons manner by the public. Tae concerte were commenced in 1892, and have been continued annually aince. Thi year it wat decided to give two concerts, this apecial effort being made with the object of eatablishing a local orphan fad for the purpose of granting immedinte relief if occanion required. The attendance on both eveninge wat very large, every available portion of the large hall of the Literary Intiltute being occupied. Programmen of more than unal excellence bad been prepared for each evening, and the ervices of everal capable artinten retained. The committee were also fortanate in secaring the mervicen of the Sale and Athton Amateur Orchentral Society of forty performers, and the Veronese Mandoline and Guitar Band, whose selection were quite a feature of the entertainmente. The amount realised, after paying expenses, wan a little over £56, forty guineas of which goes to the Gardeners' Ruyal Binevolent Inatitation, and the remainder is ratained for the local orphan fund. Since 1892 the amount of \(£ 161\) has been raised in this way, \(£ 105\) of which has been went
to the Royal Gardenere' Orpban Fand-not a bad record for a small couatry town. Other Gardenera' Improvement S cieties please make a note. Cras. Hewitt, Hon. Sec. and Treasarer.

Meeting of the Biusbels Orchideenne. -At the lat meeting of the B ausele Orchidéanne, on Dicember 8, mome fine collections of Cattleyas and Cgpripediams from l'H sticalture Iaternationale were nhown. Fow persons would bave thought, even five years ago, tha: Cattlega: would ever form a feature at an extibition held in Dicember. A Firstclass Diploms of Hononr was awarded to M. Linden for a group of eight Catasetam ; almone for Cypripedium \(\times\) capartianucn with a very large standard, broadly oblong and entirely of a purplish-red colour, shading af the base into b'reckish-purple. De. van Cauwelaert obtained a similar award for Cypripedium \(\times\) Allianam. A First-clase Diploma of Honour was alloted to M. Warocqué, for a hybrid Cypiipedium (C. Lowi \(\times\) C. villosum), with a atandard like that of the latter parent, unfortunately mach bear, and with petals like those of C. Luwi very narrow at the base, bent back, very wide at the tip, and there tinted violet-rose. Firat-class Certsfisutea of Merit were swarded an follows:-To M. Linden, for Cypripediam \(\times\) Leeanum; to M. Warocq2e, for C. Curtial \(\times\) C. Lawrenceanam, \(\mathrm{A}_{\mathrm{o}}\) wera very large and massive, resembling thos of the latter pareas with the petals dotted with nameruas black warts tinged with red at the tip, the slippar very larga; to M. Van Imshoot, for C. callosam \(\times\) C. Argas Mce asi, most resembling the first parent, but with petale aputted snme what se are those of the other ; to M. Madoux (è l'unanimité) for Vanda Amesiana, very well-flewered; to M. A. Van Imshoot (à l'unanimité). fur Odontoglossam crispum; to M. Mydoux, for Cibtleya Warocquesas and for C. Harrisonæ (ooth à lunanimité), the latter with two flower-apike bearing very pale ronecoloured flowert with \& white lip bordered with very pale rowe and shaded with primrose-jellow round the entrance of the throst. Similar awarde were made (d runanimite) to Mr. H. Kaight, for Cattlepa maximas Leopoldi, with very larke deep red flowers; to M. de Lombaerdo (à lunanimité), for Oacidium variconam Rogersi, very tiae, wich large, richlycoloured flowers; to M. T. Pauwele (à l'unanimité), for Phalmpopsis rosea, rare, and with a tiae floral raceme; to M. de Moerloose (à l'unanimité), for Cattleya Warocqueana; to M. Maduux and to M. Pauwels, each of whom howed a plant of C. Warocqueana, the latter a very curioas one with a large straw-coloured lip, faintly bordered with very pale rose, and with a little red apot in the middle. Other First-class Certificstes were won an follows:By M. F. Panwelw, for Palreaopaia Schilleriana, bright roe-coloared; by M. Van Imahoot, for Odontoglonnum crispam; by De. Capart, for Lxelia Gouldians, deep purplish-red; by M. H Kaight, for Cattleya Warocqueans; by M Van Imshoot, for Lycaste Lacieni ; by \(\mathrm{D}_{\text {c }}\). Capart and M. Madoux, each for Cattleya Warocqueana; and by M. F. Pauwels, for Paalæiopsis grandiflora. Sacond-clas Certificates of Merit were awarded to Di. Van Cauwelaert, for Cypripediam \(\times\) Leeanum, with very large and almont wholly white standard; and two others to M. Madoux, for two more peciment of Castleys Warocqueans. M. Linden won wo Firat class C-ttificatew for flowering; one for Cattleya maxima gigantea, the
other for Vanda coruleaceng.

The Royal Botanic Society.-A meeting of the Fellows of this society wat held in the Museum at the Royal Botenic Gardene, Ragent's Park, on Saturday afternoor, 14th inst, Mr. G. R.'Ryder presidiag. Lady Twerpaouth, Mr, R. Heap, Mr. P. S. MayHew, and Mr. Joun Russelit were elected Fellows. The receipt of the following donation wat reported: Specimens of the flora of Havana, presented by S ño J. I. Torearbas, of Hzbana; Gowering pecimens of the B ae Gam (Eacalyptue globalus) and Acacia from Canne, premented by Mien Laighton. The secretary called the attention of the Fellows to
tome specimen of the society's uaique collection of
economic plante growing in the garden, iacluding Zomia integrifolis, Weat Indies; Caryota urens, India; Tapioca (Msaihot atilissima), South America; Arrowroot (Maranta arandinacea), Weat Iadies; and Canas edulis, India. There were also on exhibition a nuaber of artificial Ochid and other flower forwarded by Mer. Emett. The apecimens, which were exquisitely formed of a composition of wax, were so true to nature, that it was only by a close inspection and comparison with real varietien that any difference could be detected.

The National Chrybanthemum Society. -At the Geand Jabilee Calebration, to be held at the \(R\) igal Aquariace, Weatminster, on Tafeday and three followiug daya' (Nuvember 3 to 6) afxt year, we learn from \& preliminary achedale of apecial Jabilee prizos now issued, that the prize are offered in addition to those which are aanal at the November exbibition, and that these classes will be repeated in the schedule to be isnued at the end of the month of March next. Amongat the prizes is an open one for a groap of Caryanthemam plants in pots, to conaist of any rarietier, mingled with foliage plants (the foliage plant not necessarily to be growa by the exhibitor), to be arranged for effect in a circle of 12 feet in diameter. Tais prize will conaist of the Jabilee Medal in gold, and money prizen as well. Another God Jubilee Medal and movey award are offered fornine trained apucimen Carysanthemame. incurved reflexed or Japazesp, distinct; and a Suver-gilt Jabilee Medal and money prizes for six trained Specimen P.mpon Corysanthemums, distinct. These are likewise open competitions. Ia the cat-bloom clanef, Guld Jabilee Medala and money prizes are offered for sixty Japanese Corgsanthemams, distinct; and for sixty incurved Chrysanthemams, in not fewer than thirty-six varieties, and not mare than two of any oue variety. Good prizes are offored for thirtysix Anemone flowered Chrysanthemams, one bloom of each, distinct ; and twelve Pumpont, three bloom』 of ench, distinct ; swelve varietios of reflex \({ }^{\circ}\) d Cary anthemunn, thre blooms of each; and twelve varietie of Pumbon Caryanthemame, six blooms of each (Anemone Pumpons excladed); twenty-four varietiea of aingle Carysanthemanf, twelve large-flowered, and twelve mall-flowert, three bloom each of large varieties, and six blooms each of amall ones. Taese are open competitions. There are competition for growers for market in collection of fruit; special Jabilee \(\mathrm{pr}^{2} \mathrm{z}\) ?. , by various narserymen, for cat blooms; and for collections of vegetables, \&c.

Horticultural Club. - The monthly dinner and conversazione took place at the H stel Windsor on Taesday evening, 17 h inst. Taere was a large attendance of members and viaitors. The chair was occupied by Mr. Harey J. Veitce, and thare were present amongst otherp, the R.v. W. Wilk, M-ars. Philip Crowlev, Jamea Walker, Gıorge Monro, A. H. Pearson, George Pan', Peter Kiy, B. Selfe Leonard, James Webber, J. Asebep, and Arnold Mos* A very interesting and instructive addrean wa given by Mr. Gien. Monro on "Tae Fruit Sapply of Covent Garden." It was thoroughly practical, and was much appreciated by all present. Is also originated a brisk diacuanior, during which many surjects of great importance were touched apon. A hearty vote of thanks was given to Mr. Monro for him admirable address. Mr. Peter Kiy, of Claigmar, Finchlev, sent a basket of very beautifal Alicante and Canon Hall Mascat Grapes; and Mr. Suea alao sent a diah of very beartifal amplen of Gacoigne Scarlet Apples.

Mr. George Such.-American papers record the death of Mr. Sucr, of Amboy, New Jersey, a well-known horticulturiat, the fame of whose collections travelled to this aide of the Atlantic.

Colours of Flowers - The Scientific Committee of the R yal Horticaltural Society is deniroan of carrying out some experimente upon the effects of ingredient in the eil upon the colours of flowers. The Secretary will be glad to receive any information about accideatal or other reanite which forist or
other cultivatort have met with. Any reference to pablinhed accounts of changen of coloura in flowers will be thankfully received. Addresp, Rev. G. Henslow, Diayton House, Ealing, W

Ma. C. L. AtKingon.-The death at Portemouth, on the 18 sh ult., of Mr. C. L. Atkinsons is announced. According to Garden and Forest, he for many years had charge of Mr. Jobn L. Gardner's estate in Brookline, Manachasetta, and was one of the best known and mont skilfnl gardener that America has seen. Not only wan Mr. Aternsoza a remarkably gocd gardener in all bravches of the profension, bat he was a genial, generous, and intelligent man, fall of intereating information about gardens and gardening in this country and in bis native England, which in convereation he was alway willing to impart in a pictureque, and often highly entertaining maner. An honour to the profension, be will be missed and aincerely mourned by hil friend and associaten in the neighbourhood of Boaton.

Ayrbhire Gardeners' Mutual ImproveMENT Association.- At the monthly meeting of thin Association, held in the Carrick Street Hall, Ayr, on Tharaday evening, the 5sh ingt, the Secretary read a paper written by Mr. D. Mackif, Montgomerie Garden:, Tarbolton, entitled "Climatic Influencer in Ralation to Practical Gardening." At the conclusion, Mr. Mack'e was accorded a vote of thanke; as was also Mr. M. Ganly, Glendoon, who presided during the evening. The next meeting will take place on January 2, 1896, when Mr. A. H. Scott, Cambuadoon Gardene, will read a paper on "Flowering Trees and Shrubs."
"Cultivated Piants." - In correction of a atatement that we made in our issue for December 7, Mearre. William Blackwood \& Sons, 45, George Street, Edinburgb, denire to call the attention of our readers to the fact that thin excellent and most unefal book, by Mr. F. W. Burbrdae, is atill in print, and can be obtained through any bookseller.

The Devon and Exeter Gardeners' AssoCIATION. - The annual supper of this body of Devonshire pardeners will be held on Friday, January 3, 1896, at Martin's Castle Hotel, Caatle Street, Exeter, at 7 o'clock. In order that proper arrangements may be made for the comfort of those attending, tickets mast be taken not later than Dacember 27. Andrew Hope, Hon. Sjcretary.

Newcastle and District Horticultural Mutual Improvement Society.-The monthly meeting of this society was held at 25 , Weatgate Ruan, on Tuesday, Dacember 10 ; Mr. Jjo. Bullock presided over a cood attendance of members. Mr. Lawnov, gr. to W.J. Sanderson, E.q., Heathdale, Gowfortb, exhibited a few well-grown Chryanthemam bloom: ; and Mr. Larke, North Denf, Gitenhead, Chryanthemum and Pelargonium bloom. In the absence of the writer, the Secretary read an excellent paper by Mr. Kexling, late of Willywood, Riding Mill, on "Herbaceoua and Alpine Plante;" which was much appreciated, and favourably criticised in the ditcussion that followed.

Botanical Gabdens, Moscow. - Mr. C. Mücres, formerly hofiärtner to the Arch-Dake Sergids Alexandrowitsci, has been appointed succesar to Mr. Wofst, deceaned.

Putney, Wandsworth and District ChryeANTHEMUM SOCIETY.-The annual dinner was held on Tuesday evening, 17th inst., at the Railway Hotel, Patney. There was an exceptionally good attendance of members, and the proceedings throughout were enthusiatic and cheery, most of the apeeches being full of hope that the society has started apon a period of greater success than it has previously enjoyed. In this respect considerable satisfaction was expressed that the recent show was one of the moit aucceanful yet held, but it was unfortunate that the attendance affered through the inclement character of the weather on the occasion.
-NEW LILIES. - In the N Primber number of the Giornale Botanico Italiano, are deacribed and figured, by" Signor Baroni, two nen apecien of Lilium from China. Liliam chinense and it variety atroparpaream flowered in the Florence Botanic Garden L. chinense has linear preading leaves about 4 inches long; recurved, orange-coloured flower about 3 inches across; segment oblong lanceolate, atrongly recurved, and marked with purplish spots, L Biondi has also linear leaves, but shorter than in the preceding plant; flowers of the same general character and colour, bat rather maller; egments reflexed; orange, faintly potted, and with a fow warty prominences near the base. Both mpecie come from mountains in the northern part of the province of Shen-mi.

Chislehurbt Gardeners' Association.Taere wal a good muster of membera on Taes-
treats also of Equisetums, Loscopods, and hardy Selsginellas. (Pablinher, Octave Dors, 8, Place de l'Oden, Paris.) The author deal first with the botanical atructure, fertilisation, Faristion, and hybridisation, and geographical dintribation of Ferne, then of the pecaliarities of the aeversl species treated of. The secoud branch of his subject is similarly arranged. There is a fall index of namer, and the text is plentifully interaperned with amall illustrations - The Agricultural Annual and "Mark Lane Express" Almanac for 1896. This periodical contain much of interest to those intereated in agriculture, as it includes reports of the past year, a calendar of event for the coming onp, and many hints on auch aubjecte as Potato blight, cider, butter, \&c. Postal information and similar general content are incladed, an usual in ach pablications, amongat which this should take a good place.-Christmas Numbers. The Chrintmat Namber of the Queen is,
a catalogue of reed gathered this year, and offered for diatribution to immediate applicantr.-Bulietim de la Société Française d'Horticulture de Londres This is the record of a flourishing nociety of French horticulturists who have found the convenience of having a common bond and meeting-place in Eagland. Their meetinge are held on the firt Saturday in each month at 4, Od Compton Street, and their Bulletin, benide chrovicling lists of member and other matterm relating eppecially to the nociety, contain noten on the cultivation of acme of the lest-underatood plante, and aoggentions for improving upon old method of culture.-Cider. This monthly journal, "devoted to the interente of cider and perry," in directed and edited by Mr. E Samson. It ahould do much to increase on already thriving industry by attracting more wide-apead notice to a palatable and wholesome beverage atill comparatively neglected in some localities.

Fig. 126.-a dish of the catillac prap, greatly rbduced.
day, December 10 , when Mr . W. Cuthbratson, F.R.H.S. (of Mesarm. Dobaia \& Co.), gave an interesting and iostructive lectare on "Pansiea and Violas." The lecture way greatly enhanced by a number of coloured plate and drawinga.

Garden Directories.-The new insues of those very acceptable publications to gardeners, editors of gardening journalr, and others connected with horticulture, The Horticultural Directory and Year Book, published at 171, Fleet Street, F C., and The Garden Annual Almanac and Address Book, published at 37 , Southampton Screet, Covent Garden, are now before us. They are, as asaal, replete with useful information of a varied kind, including a lint of new plants of the year. The portion dealing with gardeners' names and addrensen appears to have been carefully brought up to the present date, so far an is ponsible in books of this magnitude.

Publicatione Received.-Les Fougores de Pleine Terre (Hardy Ferns). Thi book, written by our correapondent, M. H. Corrmyon, of Geneva,
as usual, readered both weighty and balky by the number and variety of ite content, both literary and pictorial. The Happy Homs also isaues an excellent Cbristmas Namber, full of interesting and amuaing articles and picture appropriate to the season. Nature Notes for Decfmber contains, in addition to other papery, a charming article by John D. Batten on "Bats."-Sutton's Amatewrs' Guide to Borti. culture. Measre. Sutrow may be congratalated on substitutiog photographic reprodactions for the glaring and misleading chromo-lithographs once no popular. The photograph block of vegetable are beatiful in their rendering of texture and veining. - Máénm d'Histoire Naturelle. From this inatitation comes the Catalogus des Graines et Plantes Vivantes offertes pentant thwer, 1895-1896, aux établissements pubics d'instruction. This is a list of many apecier, ome comparatively little known, ave by specialist, and which, as the above word teatify, are cff: red to certain applicants. Sach plante as are not hardy in Paris are indicated by an asterias. From the Jardin de Pianter, Montpellier, comes

\section*{CATILLAC PEAR.}

One of the best known and most usefal culinary Pears is Catillac, which, when carefully placked and properly kept, remain in good condition till the apring. Although not particular in regard to noil, the tree does beat in ricb, fairly deep coil.

The fineat expalier-tree I know of, grown in the garden of Mr. Joneph Ham of Budlake Farm, Broadclyat, near Exeter. This wame garden, in the early years of the century, was in the posesation of the great-grandfather of the present head of the Exeter firm, Mr. Peter Veitcb, and it is one of the best fruit-gardent in a diatrict noted for fruit. The Catillac wap, twelve years ago, grafted on to a Beané Rance planted against a atone wall, with a south-western aspect; the Bearse Rance having done badly. The tree hat for its aize, borne well, and this year it carried from sixty to eventy fruits, which were ultimately redaced to twenty. Five of these, weighing \(9 \times \quad \mathrm{lb}\)--the beavient weighing 21 lb .-were shown at the fruit show at Exeter,
taking the let prize for calinary Peart (6f. 126). It is a remarkable fact that for nine geare in enceession, thie tree bas prodaced the 19t prizs dish of Catillac at the Exeter show. Late sear the weight
ot the five frits thown was 81 l . 12 (z , ond the gear ot the five frits on own wat 8
before a'mot the same. Ioca

ONION HIGHCLERE TANKARD
The Oaion Highclere Tankard (ag. 127, on p 747) is the reault of a crosa batween Ailas Craig and Pinesfield, the latter being the seed-bearing parent; my idea being to combine aize and better-kepping qualitien, many of the larger varieties of Onion beirg somewhat deficient in this latter respect. The aped of the Onion mentioned above was aown early in Fobruary, sad grown on for a time in a little heat, the plants being pricked cff into boxen when large enougt, hardened off in due course, and planted out-of-doors about the middle of April. Water wae given to each plant singly with a apout-can, and the Datch-hoe used to loosen the soil an soon as poasible afterwards; no more water was afforded them, and about the middle of the month of May a mulch of apent Mushroom-dung was applied to check evaporation from the aoil. W. Pope. [We selected this Onion not only for its intrinaic merit, but also for it ammetrical flagonlike form. Consumers will not consider this matter, but those who like to know "why and how" will feel an interest in speculating as to the why and wherefore of thit thape. ED 7

\section*{Home Correspondenoe.}

A britian ferneay. - As it is quite impossible, in or near large centres of labour, to get together a decent representative collection of our native Ferns withont the sid of artificial means, it follows that hous of some kind is, absolutely, a sine qua nom. Tae form that house shall ancume and the beat way to go to work to conatruct it is, perhaps, the next important point, and I think that question has been verv carefully and astiafactorily solved by Mr. Chas. T. Diuery. Personally, I am under an obligation to him for the detaila therein supplied, although I cannot now bring my own littie fernery into a aemblance of ite more magnificent rival. But that, perhaps, is hardly necesis charming. Having, then, fixed upon, variety is charming. Having, then, fixed upon the mont available spot, according to the exigencies of
the surroundings, and the capacities of the parsp, the next thing to do is to go in search of those lovely ferny forme for which wo have lately contracted anch an intense desire to possens. There are anre to be plenty of disappointments in atore to damp one's ardour, but the quest, neverthesweet fresh air, will do mach to compensate one's inability to record a "find"." Since addrusing my querie to Mr , Druery, I have been
to North Wales and Sjuth Durset. In the former place, I hunted high and low, mountain and moor, river and rcck, but I could no's find a variety worth recording. The common Polypods (Polypodicm valgare) in many places was aimply innumerable, but there was no trace of the Welah ore (P. v. cambricam). Tae Parsley Fern (Allosoras crispan) diapated with ranker "weeds" the right to occupy whole acres of Soowdon's craggy heights; but never a crested form to greet one's geza. The Hard Fern (Blechnum Spicant) was also therp, stanted and abnormal, it is truo, but that was only due to eleration and exponar, for in the valleys netling beside some quirt pool, its fertile fronds attained the length of fully 3 feet. In point of numbers then, the normal form were ad libitum, while the varietal ones were, unfortanately, "conspicuoas by their absence." And no with some other Ferns-aptcié galore; varietiea non u'la; i.e., not anfficiently distinct to warrant recognition as such. The ordinary Fern-hunter, then, will have to be content with pecies; the more-highly developed forms mast ba sought in other quarters. When, however, the Fern have been acquired by hook or by crook, they mast be either potted up or planted out, and this will be largely dependent upon the constraction of the hoase. If they be tranuferred to pote, they will require constant supervision. 1f, on the other band, they be planted out in a good body of aitable soil, they will not only give infinitely less trouble, but will remain in finer condition over a longer period. As an inatance, I may mention Athyrium f.-f. Elworthit, which persiatr, with me, three or four week alter a daplicate in a pot has died down, and so with the apecies. Bat it may be here remarked that deciduous varieties generally seem to have a tendency to live or, more or lea, long after their progenitors have gone to reat. A. fo-f. gives up its cërial existence about the end of October; A. f.-f. criatatum continues for another month; whereas A. f. fo plumosum Drueryii pervists till Christmas, and so with Osmanda and ita varieties. The type goen first, then cristata follow, while palugtris is practically evergreen. O\& courap, I refer to planta under glaar, and I agree with Mr. Dracry that the less artificial heat the better. All I aim at is the exclusion of frost, and for this purpose 1 usp, in severe weather, Wright \& Butler's hotwater oil-atove. Thus I am enabled to preserve the fronds of the evergreen pecies and varieties all through the winter, and they become not only things of beanty, when everything else has failed, but perpetaal joyw. A neighbour of mine is fond of twitting me about the time and labour I give to British Ferne, when, he ady, you can go to Kew and wee a far better collection. MTr reply iv, "True; but thone are not mine : thene are." Posseasion is better than denire ; but tomehow or other one is al way s wanting what one has not got. Moreover, it often happens that the beat varieties fetch the higheat pricea, and are consequently withont the reach of those with limited means. That "man wanta butlittle here below" is quite a fallacy-he is alwaye running after "good things:" and Mr. Druery refers me to some good thinge when he auggests a perasal of his article for August 27, 1892. Mr. Druery may be pleased to learn that the accompanying illustration of his decorative Fern-house occupies a neat little Oak-frame on the wall of my sitting-room, and often inapire me to higher aim. C. B. Green, Myrtle Road, Acton, W.

CATTLEYA BOWRINGIANA - For the information of your correapondente who have written about thi apecies of Cattleya, it may be mentioned that recently a plant here produced a apike with twentyfour flowers. I cannot think that there is anylhing remarkable about this, as seven plants of this epecies are nearly the total number of our Cattieya plante, and the plant in quention has been here seven or eight yeary, and abjected to a temperature considerably above that usually recommended for Cattleya. Years ago I had some experience amongat this genas, and jadging from observation made at that time, I believe C. Bowringiana to be an eatily-cultivated apecien. It undoubtedly has a good conatitation. Thomas Coomber, The Hendre Gardens.

LAAGE ONIONB. - The fine collection of homegrown Oaions exhibited at the Drill Hall on the 10th inst, by Mr. W. Pope, of Highclere Catile Gardens, was one of the best of ite kind over presented from a private garden. There was furnished inatractive evidence of the remarkable effects of high cultare on these bulbs as compared with what resulte from ordinary culture. For, in ieveral cases, bulbs of the asme variety, bat grown under diverte conditiong, were shown. The couditions
were, sowing cesd in shallow boxes in January, and in gentle warmth uader glass, growing the plants on thialy in frames, and when stout and strong, transplanting into well-prepared soil, mach more thinly than usaal outdoors in Aril; or aowing seed in shallow drills on sil prepared as usual for Oaion, and in the open in the month of March, giving, during the season, suct thinning and cultare as is common. The transplanted plants mostly eacape attacks of the maggot, and being pecially thinly planted and robast, asually also anfer leas from mildew than plants raised in the ordinary way. As to which method of cultare will give the greateat weight of balbs per rod of groand, there seeme to be at present no information. Mr. Buwerman, at Hackwood, who this year grew the heaviest balbs, grows his transplanted ones every jear on the same ground. and fiads improvement in weight and abatance yearly also. It worthy of conideration as to whether auch aplendid bulbs as those hown from Highclere, Hack wood, \&cc., would not pay to prodace as a parely market product. If the pablic know how aperior in texture and flavour they are to any other Oaion, impurted or otherwisp, a great demand for uch balbs would doubtless soon arise. A. D. UA products of cultaral skill these very large dishes usefa', bat in general ase in the househol? they are watefol to a degree. ED]

THE A. F. BARAON NATIONAL TEBTIMONIAL.I whould like to suggest-quite anofficially, of course -that the secretaries or tressarers of the numerous metropolitan and provincial horticultaral aocieties be requented to make some contribation, however mall, to the national tentimonial now in course of formation for Mr. Barron. Is is not moch the amount, as the widely-extended nature of the aubscriptions, that is wanted in a case of thim kind. Some of us are anxious that it should be really national, as a genial expression of fellow-feeling for one of the most generally respected membern ol our profeasion. The act of the \(R\) jyal Horticultaral Society in offering a life-membership to their late garden auperintendent, might well be emphasised by the Council making some special grant to this popular teatimonial. The Chairman of the Committee in Dr. Masters, F.R.S., the Hon. Treasurer is H. J. Veitch, Esq , F.L.S. and all unberibtions, \&cc., ahould be sent to the Hon. Secretary, B. Wynne, Eıq, 1. Dane' Ian, Strand, Lindon, W.C. F. W. Burbidge.

APPLE NEWTON WONDER. - In answer to Mr. H. Markham' letter ia the Gardeners' Chronicle, p. 710, respecting Newton Wonder Apple, I wish to say that I was the raiser of the variety, and not Mesars. Pearaon \& \(S\) sns, Chilwell, as atated; and that with regard to it good qualitien, it cannot be too highly spoken of. It is an excellent culinary and dessert Apple from the end of the year till Jane. As a proof of ita ker ping quality, I have exhibited fruits of the previous year at several ahown in the month of Jaly. The tree growa freely, crops well, and is not liable to canker. I have a "liat" of young trees which were grafted three and four years ago which carried a fine crop of fruit this year. The mother tree, now twentr-seven years old, stands in my garden at King's Nowton, and, if I remember rightly, it came into bearing in 1876. When Menart. Pearaon became acquainted with the variety they wrote expressing the wish that I would sell the tree; but I declined to do thin. Then they inquired if I would sell them fifty trees, which I did; and also gave them a dich of fruit, which they ent or took to the Royal Horticultaral Suciety's meeting at Chiawick, receiving a Firat-class Certificate on December 13, 1887. Wm. Taylor, King's Newton, near Derby.

IMPORTATION OF HORBERADIBH.-I gm exceedingly pleased with your remarks on p. 683, renpecting the importation of Horseradisb, and would very forcibly endorne the remarks that I made at the meeting of the Royal Horticultural Society. The "imported Horseradiah" bas acarcely any flavour, and may be generally known by its epecial manner of growth, which is very different from the homegrown roots, which, if properly caltivated, are only one year's growth, while the Datch is at leat two years, sometimen three years old, being grown from what gardeners call "jags," that is, amall roots. By this method the aticks are larger, but tough, and almont taateless. They may be known by the forked rootlets at the bottom of the atick, and their anandy colour. The Eaglish produce is cat straight of with the spade, and has no roota at the end of the ntick. The ale by the retailera or greengrocer of
the Datch Horseradish has ruined the trade to a great extent; the pablic will, not use Horseradioh becanse imported roots are generally offored them, and after trying it a few simes they "give it up." \(\mathrm{M}_{\mathrm{y}}\) advice to lovers of the root is to obtain sone of each wort and try the diffarence, and I am conviaced they will not again use other than Eaglish roots. The reason the greengrocer prefers to soll the Datch is very plain; he can bay it at a very low price, sad even this is more than it is worth. I often tell my

In Jane, 1894, I planted some in a very exposed poaition; atter the abnormally nevere weather of February last, I fally expected to aee them killed, but was agreeably arprised to find them uninjuredwherean the common Laurels a few yards away were severely damaged, and many of them killed. B. Metake is no doabt the hardient of the species. I find that Jane is the best time to plant, which should be in well-manured nil, afterward giving liberal supplies of water. \(W, B, G\).

 ( BRH P. 746.)
cuntomers in the market, "You may as well buy Parmipy and ncrape them, as use this imported thaff." J. M. Mason, Market Gardener, East Greenwich, S.E.
bambusa metake.-Considering the limited number of ahrabe that thrive well in Londou and other large town, where the atmospheric conditions are so very detricaental to many thinge. we cannet affurd to ignore anything that does thrive well. It has often surprised me that Bambasa M M take is not mach more extensively planted, ualess it is that many people imagine it to be less hardy than it is.

MORELLO CHERRY CULTURE, -In theme time for reasons of economy in manal labour thers is one department of work that remaina pretty nearly impregnable to all innovation, and that is the pruning and nailing of froit trees. Glancing at what our predecessors in the profestion did in this line, and comparing it with that of the present, my impreasion is that it was better done then than now; and the is that it was better in the Gardeners' Chronicle by Mesars. H. W. Ward and D. T. Fish, in reference to the Morello Cherries in Scone Palace Gardens, is a notable example of the trath of my contention. I cannot nay in what condition those tireer may now be,
but I have a vivid ffcollection of what they were fifty yeare ago, and few indeed of thoue who had the privilege of nailing tbose treea can readily forget the appearance of the wall when finithed. Under Mr. Dudds, frait culture was really well done, bush, pyramid, and standard treea wese all grown, but the walle were a pecialty, and the treat modele of neatness. The effect ot Mr. Dodde'trainirg on myelf was such that, when ciscumatances placed a wall covered with Morello Chersits uoder my own care, I made it a point tokep the praning of the tree entirely in my own handa, and bave done ofor more than twenty years. The oil in these garden is a atrong loam with a clay botom, which is unfavourable for the longevity of the treep, at it lead to gumming and canker at the bottom. The Morellon at Scone were certainly at home in the matter of moil, which in fairly atrong, as thone who had to trench any of it will remember, and in dry weather it was hard atuff to pulverise. G. Smith, Vice Regal Gardene, Eublin.

RHODODENDRON CUNNINGHAMI -In a garden in a sheltered part of this village is a buah of this beautiful plant now in fall bloom. It has been in this condition all this month, notwithetanding that on three occasion during the lat fortnight the thermometer has been down a tew d grees below freezing point. The plant is 5 feet high and 6 feet through, and han a trus of six to nine flowers upon nearly every branch. It forms a cunppicuous ohject amonget other shrabs, none of whtch are in bloom excepting two species of Chimonanthas. The only bite of colour near are the scarlet hipa of Rona rugona. The air is highly acented with Aponogeton in a neighbouring pool, on the margin of which a strong clump of Bambasa palmate is dieplaying ith apple-green bread leaves. W. T., Bishopsteignton, B. Devon, December 14.
game covert planting - My experience with Rhododendron ponticum at a covert-plant teaches me that thit rabbit-proof evergreen can be overdone. I have seen it planted thickly for the encouragement of winged game, but in the course of a few yeara it had growr, and become so dense, that it proved quite the reverae to what was intended. [Why not thin? ED] Tae bybrid Rhododendron I have no experience of for that purpose, but should asy these would anawer the parpone better, being erect-habited an a rulp, lean rampant, withmore rigid brancher, thas allowing the birde to move about freely, and make their encape when molested. I thould eay that thene are alluded to by Mr. Harrison Weir on p. 684. Where auitable soil existr, there is not a more useful and ornamental hardy shrub for covert planting than the Rhododendron, bat K . ponticum chould not be too eztenaively used. Where rabbita are kept dowr, Cutoneaster Simonai makea an attractive and uaefcl covertplant, which, when afforded light, growe freely, and is covered in the autumn with acarlet berrien, which pheamante eat readily. But this shrub, like so many otherp, is sometimes deatroyed by the rabbite. Rosa ru ons, I regret to hear, sbares the ame fate, which is a pity, an when planted in clumpa of moderate siza, it would aurely be an acquisition. On p. 685 a correapondent aaked "H. G. C." if he would give the names of a few plante which he has found to be rabbit-proof, and I hope the latter will be able to do so [epe p. 719, Ed.] Now I am writiog, I may mention a plant which I have found "rabbit-proo"," that in, the common Box; and on a limestone or chalky eoil I do not know of a more asefuland hardy ahrub to plant than Box as a covert plant; ite only drawback is it comparatively alow growtb. Sime yeara ago I procured a aeglected Bux edging from an old garden, which, after pulling it to pieces, I planted over a conviderable space of wooded gronnd, montly O.k. The wood warmed with rabbits, bat to the beat of my recollection, not a Box plant wat injured by them, and in a year or two the plante had become quite reapectable little bashes. I consider thin to be the best ase to which old overgrown Bix edging can be pat. Whether the "tree" Box is touched by the rebbits, I do not know. On the wame entate, we had one old bush which uned to seed freely, young plant coming ap on every nids. Is not this a very anonal thing? J. Easter, Nostell Priory Gardems.
cephalotaxue drupacea.-Roferring to the nota and illaatration of this evergrepn ahrab at p. 717. I should be glad to kuow at about what age this plant bears seed. There are several plants in this garden, nome of which have been growing in their presant sites meventeen jears, but as yet show no nign of bearing fruit. I note this plant, like
many others of a aimilar type, quickly changes the coloar of ite leave from a deep to a pale green when growing in toil too heavy and retentive of moistare, or where chalk abounds. E M. [As male and female flowere grow on different plante, your planta are doubtlesa all of one gender, hence the sbsence of need. En.]

THE USE OF DECIDUOUS FLOWERING SHRUBS. - "J.," p. 719, in his concluding remarke anent the planting of Apple treea in shrabberies, alludes to much felt want in the beautifying of so many ahrubberies. Too often these are planted sbundantly with Laurels. Yows, and other equally common sabjecte, many of which might well be dispensed with except in special cases such as forming acreens to shat out objectionable buildinge or obtain privacy. True Portugal and the Common Latarel in its varieties are puitable chrubs for planting in the partial shade where perhaps nothing elso woald grow. In the open, however, other genera ahould be employed in preference. In planting shrubberiex, whether it be with flowering plante or with evergreene, there is generally far too much of the "dotting" method practised for the planting to be effective, eapecially when the plant employed are of mall size. How mach better a group of, say, six to twelve plants of any apecies would look as compared with the plan of apreading the same number over fifty lineal yards of a border. Take, for inatance, the different varieties of the Pyrus family, the Deatzias, Broom. Syringa, Weigela, Almonds, or even the common Ribes zangaineum and others, which, if planted in bold masses, affosd a much finer effect than in the other manner. Not only to flowering plants do these remarke apply, but to subjecte that are planted for the beanty of their branches or foliage. For inatance, the common Dogwood, Cornas anguinea, is most beartiful when seed in a mass of ruddy shoote, and the shrub looks well when growing beside watel, \(E . M\).

I can endorse all that has been aiaid in thene pages of the auitability of varieties of Crab for planting in the garden and pleasuregrounde; and when I have been given a free hand, I have done this for come time past, and the effect has been greatly appreciated by ownerit of gardens. I ahould, however, plant the large fruiting varietier, beautiful as they arp, in the orchard or kitchen gardon, the trees lacking the lightness of habit, and the fruite the brillisccy of colouring of
the amaller-growing and fruiting onen. \(H\). J. McRonald, Chichester.

THE ROYAL HORTICULTURAL SOCIETY'8 COM-MITTEE8.- Without going so far as to inclade myself as one of those gardeners in the provinces who do not read the reporte of the London meeting", I can cordially re-echo the parport of "J. S. W.'s" remarks (p. 719). For aome years patt I have met intelligent fraternity who have condemned the idea of London alone being thought the "hob of the aniverse" at to granting certificaten to the varied produce of gardens. These pernons were not gardeners alone, bat inclade others eminent in the nureery and allied trades connected with horticulture. Permonally, I hare watched with interest the general good work done by the Royal Horticultaral Society, but seeing that we cannot all reaide near Londor, I do not see why it ahould not extend its influence outwards all round. These are days of decentralisation in many important matter, why not the Ruyal Horticultaral Society follow anit? Sarely there is plenty of organiaing power in the horticultaral world to work out a feasible scheme of local govern-ment-if it was only put to the test. Of one thing I feel mure, vik, the Royal Horticultural Society will never gein the support of the main body of country horticulturiste antil its worth is brought nearer to them in a practical form. Why not have local committeen near every large city and town, where long and succesaful exhibition are held, giving them power to grant certificates for meritorious specimens, as from the Royal Horticultural Society? In districta where gardons are plentiful, quarterly, or oven monthly meetinge for a portion of the year, might be held for the same purpose. I might aay more, but will refrain-firat, becase otheri more competent may perhaps take the matter up; and ecconc,
I shall be treapasaing on jour valaable epace. H.J. C., December 16.

Your correspondent "J. S. W." in yoar isune of December 14, opens up an important and interesting aubject, when he auggeats that aomething might be done to bring the Royal Horticultural Society" into cloter contaet with horticulturiate all
over the country." That there would be some difficultie to surmount goes without saying, bat if there is sny way by which the society could eatablish itaelf in the hearts of the people in the more diatant, but yet important centrea in the kingdom, these difficultie would soon disappear, and the connection thun formed would no doabt be the means of atrengthening the society in varions waye. Your correspondent ayy "that provincial men have not balieved that all the talents were confiaed to London and neighbourhood," and the committees and local men might well reply " oo asy we al!." It is nevertheless true, that were it not for thone men who have not "ull the talents," the Royal Horticultural Society would cease to be a factor in the horticultaral world, for the "proviscial" men rarely attend it meetinge, and sad to think, some of them do not even read its reports-or when they do so, they give tham bat mall crelit. The horticaltarists arouad Luadon and in the nearer counties keep the fortnightly meetinge going for the most part, and are rather entitled to the thanke of their provincial brethren than otherwise ;while to assert that more scant justice is done to distant fellows or to exhibits coming "from afar" is an insult to the committeen, which every member of them will reaent. An exhibit from Scotland, for example, will have due allowance made for its long journey. \(\mathrm{Ba}^{+}\), granting that thinge are at present well done, is there no posibility of improving them as "J. S. W." saggeats, by having provincial committees who woald ait in various centres from time to time, and before whom locally raised, bat atill it may be most meritorion, plants, flower, fruits, or vegetables might be brought by persons who had no opportanity of placing them before the regular committean in Lindon? By such an arrangement the Royal Horticaltural Society would be brought into closer contact with the district, and I am convinced that many persons would become members when they found nome of the society's work to interest themselves in. It ip, perhap, not to be expected that those in the immediate neighbourhood of the seciety's meetings can exactly measure the feelings of those at distant centres; but, apeaking for myself, who war, until recently, located on the other side of the border, I have often, in past yearr, expressed the hope that the time would come when the Royal Horticaltaral Society would find itzelf able, like the Royal Agricaltural S sciety of England, or the Highland Society of Scotland, to make a real royal progrens through the kingdom from time to time; or if not that, then to have committeas at various centres armed with its power and authority. These committees would, of course, be in direct touch with the London centre, and might-to main tain a closer link with the head-be presided over by a capable member of the central body. A glance at the list of Scottish fellown, or even north of England onen, will impress anyone with the idea that something should be tried to make an improvement. A small committee should, at the annual meeting, be appointed to consider the matter. Robert Fife, Orpington, Kent.

Dresden.
INTERNATIONAL HORTICULTURAL EXEI. BITION AT DRESDEN, MAY, 1896.
Tae Committee of the Second International Horticaltaral Exhibition to be held at Drenden from May 2 to 10, 1896, has the great regret to announce the death of both the Honorary Prenidente, Mr. Alfred Steibel, Mayor of Drenden, and the Firat Prenident, Mr. Gartar Krause, Director of the Royal Gardens of Dresden. Both gentlemen have always whown the higheat intereat in all matter concerning the exhibition. The prevent advanced atate of the andertaking is in a high degree due to the kill and munificence of the deceaved, to whom \(S i x o n\) horticulturist are greatly indebted. Their memory will be held in honour by all who had the pleasure to be connected with them.

The Honorary Presidentahip hat now been beatowed apon the present Mayor of Dreaden, MBeutler, Privy Councillor of Finance, while Mr. Radolf Seidel, nurueryman of Lanbegast, near Dreaden, has been elected first President of the Committee; Mr. Fr. Bouché, Director of the Royal Garden at Drenden, and Mr. L. R. Richter, nurneryman at Striesen, Drenden, are second and third.

The works on the exhibition grounds are proceed ing astiafactorily. The beantifal main bailding is nearly ready, so is the surrounding park, which had to be laid out afresh efter the denigas of Mr. Bartram, Köjigl Gartenban director as Dresden. The annexes to be erected in addition to the main palace will be commenced in the cuarse of this month, and all will be ready in time for the opening. In general everything has been done to make this Dresden Dscennial Exhibition a great anccess.

\section*{New Invention}

SEASELL'S PATENT ORCHID-BASKET.
Faseion asserts itself in most thing in soms manner or other, and lately it appears either that the Orchid-grower is getting tired of the oldfashioned Orchid-baket, or that the inventor: are determined that he sall try other of a different pattern. Several of these new invention have been advanced lately, and Seasell's Patent Orchid-Basket has new featurea which warrant its trial in gardens. The inventors, particalarising one important thing in its atructure, say "the top of our banket being round and sancer-thaped, the water (which can bo applied by a watering-can or ayringe whilat the plant is in position) is carried direct to the centre of the compont, wetting it all thoroughly, and the four top corners being left on, prevent rapid evaporation." Many other advantages are claimed which practical test will no doubt noon decide. The basket in neat and seemingly darable, and so, no doubt, will meet at least aume of the requirements of the grower.

\section*{SOCIETIES.}

\section*{ROFAL HORTICULTURAL. Scientific Committee.}

Deormber 10.-Present: Mr. McLachlan, in the chnir; Dr. Müller. Dr. Russell, Mr. Michael, Dr. Bonavia, Rev. W. Wilkg, and Rev. G. Henslow, Hon. Sec.
Carnations attacked by Grubs. - With reference to Dianthus glacialis destroyed by larver, brought to the last meeting by Dr, Müller, Mr. McLachlan added to his previous observation that he presumed that they were of the same nature as those brought before the Scientific Committee in 1892. The perfect insect obtained from those grubs was then determined to be Hylemyia nigrescens, for many species of black flies infest greenhouses, and it is imposmble to distinguish them from the larvee alone ; but on one occasion whes they were bred they proved to be the species named above.
The Colours of Flowers.-The question was raised whother t would not be possible to carry out some experiments with various substances in the roil to test their effecta upon the colours of flowers and fruits. Mr. Wilke remarked upon the effect produced by hoeing in quicklime and soot over the roots of various Apple trees, with the result that a crimson-egarlet hue was imparted to the fruit. With regard to the supposed action, it was a question how far the lime could affect the colour, for if the ammonia was presented in the form of sulphate, it would tend to fix the lime, though the soot itself would certainly be a vehicle for the ammonia. This is a known agent for improving the colour of Balsams, Weigelas, \&e. ; peat also uppears to have a similar effect. Hence the deeper coloration would be due to the enhancing the assimilating powers of the foliage. The case of Viola oalaminaria was mentioned, 2 speciee which absorbed salts of ziac from growing in localities where the carbonate of this motal was abundant; and Dr. Müller alluded to the peculiarity that it did not appear solely as an accidental ingredient in the plant, but that it actually entered into its constitation. Mr. Wilks was good enough to placa some Apple trees at the disposal of the committoe for experimental purposes, and it is aleo proposed to use white Hyacinths as soon as the procedure shall have been determined upon by Dr. Mülles and Dr. Russell. The committee will bs glad to receive information from any correspondent who may have had experience in the changes of colours through the action of the soil in any way.
Cypripedium, Origin of the Slipper. - Dr, Bunaria gave the following possible morphology of the labellum of this Orchid -"In Canada a wild Cypripedium (Selenipedium) acaule has a natural slit down the median line on the front of the slipper. This suggests that the alipper may have been originally an open labellum, like that of other Orchids, while the incurving of the edges and their final fasion made a slipper. To-dsy at the meeting I saw a Cypripedium with its alipper open. Thi may have bsen an aocidental reat; but, supposing this to be so, the fact that the rent occurred dowa the median line show , Moreovar in several there was listinct line down the middle, and in in several there wased towards that line : in othere both the veins and median line were obliterated

\section*{EDINBURGH BOTANICAL.}

Deosmber 9.-The monthly meeting was held in the rooms of this rociety, St. Andrew Square, on the above date, at 8 P.M. ; the president, Dr. A. P. Aitken in the chair. After the conclusion of the private business, consisting of the reports of the council and the election of new members, the first item of public business was the reading of an obituary notice of Professor George Lawson, by the assistant-secre tary, Mr. J. Terras, B.Sc.
The only exhibits were plants from the society's garden, and consisted of Asystasia scandens, Catasetum Christyanum, Corynostylis hybanthus, Aphelandra chrysops, Luculia gratissima, and others.
A report of the excursion of the Scottish Alpine Botanical Clab to Tyndrum last August, was read by Dr. William Craig, who describel the plants found by meabers of the party. A desceiption was given by Mr. J. H. Burragra, B.A. of the male inflorescence of Nepenthes bicalcarata, with drawings from microsospical sections of the glands.
The curator, Mr. R. Lindsay, read the report on "Vegetation in the Batanic Garden," and stated the absence of fruits this season was very marked. Mr. R. L. Harrow exhibited the specimens namol above, and read a few notes on plats in the plant-houses.
The report of the Meteorological Observations taken at the garden duriag November, was read by Mr. A. D. Riohard sox. The maximim of the self-registering protected thermometer was \(57^{\circ} 4^{\circ}\) on the 11 th; mainimum \(29^{\circ} 9^{\circ}\) on the 2nd. Frost occurred on two days. The maximum of the radiation thermometer in the sun was \(91.6^{\circ}\) on the 10 th ; minimum on grass, \(19^{\circ} 5^{\circ}\) on the 2 Id . Frost on grass occuries on fourteen days. Rain fell on twenty-three days, the total fall being viz. 0,320 iach, fell on the 15th. The mean of the barometer riz, 0.32 J inch, fell on the 15 . The mean of the barometer
readings at \(9 \mathrm{~A} \cdot \mathrm{M}\). was 29.717 inches, being 0.113 inch below average for November for five previous years.

\section*{Colonial Notes.}

\section*{NEW SOUTH WALES.}

Ma. J. H. Matden han publinhed, under the anthority of the Colonial Government, a handy little pamphlet on the timber of New South Wales, and the trees by which they are furnished. It is valuable not oniy for the practical information it contains, batialso as a means of fixing the popular nomenclature, which is very chaotic.

\section*{Quegnsland.}

From the Department of Agricalture, Brisbane, Queenuland, comes Bulletin XII., for October, 1895. Its pages deal with Pestiferous Fungi, by M. C. Cooke, M.A., and Peculiarities of the Qusenaland Flora, by F. M. Builey, F.L.S., both valuable and iateresting papers, to which we shall allude hereafter.

\section*{Jamaica.}

Mr. Fawsatt has issued an interesting report on the work of his department for the jear ending March, 1895 , an 1 to which we mast call farther attention later on.

\section*{Trade Notice.}

\section*{THE SAITAMA NURSERY CO.}

THs following letter, under date of November 1, 1895, has been received by us from the manager of the Saitam 3 Narsery Co , 26, Nishi-Tateno, Tatinka, Kita-Adachi, Saitama-Ken, Japan:-"I beg to inform you that I have established a company called the Japsu Saitama Nursery Co., for purposes of direct exportation to foreign coantries of all varietien of plants, seede, balbr, and expecially Japan Lilier, sad if favoured occavionally with your ordert, I will enteem myself indebted. The place in which I am now living is the habitat of the Lily in Japan; therefore the apecies obtainable are much finer than those of any other part of Japan. My own expzrience an a bayer enables me to parchase the mont spproved goods as cheaply as any long-entabliahed lurtery here. I have edited the Collection of the Lilies of Japan. I will present you with one volume, and I wish you to send many orders for Lilies! Oar Japanese editor-nurneryroan telle us further of Lilium gent a price-liat of the principal species preking, grown by him, and the prices inclade packing, boxing, and transportation to the ship. He it decidedly quite up to date.

The term "accumulated temperature" indicatizs the angregate amoant, as well as the duration, of degrees of temperature above or below \(48^{\circ}\) Fahr. for the period named : and "this combined result is expressed in Day-degrees-a "Day-degree" signifyiag \(1^{\circ}\) continued for twenty-four hours, of any other number of degrees for an inversely proportional number of hours.]

The districts indicated by number in the first column are the following:

THE PAST WEEK.
THe following summary record of the weather throughout the British Islands for the week ending December 14, is furnishel from the Metearological Office:
"The weather during this week continued in a very changeable and stormy condition generally. A good deal of rain fell over the Kinglom but the fall was comparatively slight in the north-east of England. Thunder and lightning were experieaced in diffarent localities on the 12 th or 13 th .
"The temperatu"e underwent considerable and rapid changes, but the avarage for the weol did not differ materially from the normal value; in most of the northern districts it was slightly below, and in the south a little above the mean. The highest of the maxima were recorded on the lith, when they ranged from \(56^{\circ}\) in ' Ssotland, W.,' to \(49^{\circ}\) in - England, N.E.' The lowest of the minima were registered either on the 8th or 11 th, and ranged from \(20^{\circ}\) in 'England, S..' and \(23^{\circ}\) in 'Ireland, N., Scotland, N., and England, E." to \(29^{\circ}\) in 'Scotland, W. and England, N.W: In the 'Channel Islands ' the thermometer did not fall below \(40^{\circ}\)
"The rainfall was rather leas than the mean in 'Scotland, Eagland, N.E., and the Channel Islands;' in all other districts, however, there was an excess.
'The bright sunshine somewhat exceeded the moen in Ireland, the greater part of Scotland, and the south and east of Eagland; but was just equal to or less than the mean in the other districts. The percentage ragiatered of the possible duration ranged from 29 in 'England, E."' and 27 in 'Eapland, S." to 12 in. Fagland, S.W., \(g\) in 'Scotland, Mon' and 7 in 'England, N.W. and the 'Channol Ialands."

Cultivation of Plants under Coloured Glasieg. - The Saptembar iusue of the Journal de la Societt Nationale d'Horticulture de France containe a nus giving the following al the reault of M. Zacharbwicz's recentexperimenti on the cultivation of forcad Strambercies under difiorant coloured glasses:-1ut. The fiaest and carlient fruit wat rained under ordinary glans. 2ad. Orange glane atimulated the vegetation, but was prejadicial to the quality, sizs, and earliness of the fruit. 3rd. Violet glast yielded a grast daal of fruit, but amall, inferior in quality, and not very early. 4th. Rod, blue, or green glasese proved detrimental to the vegetation of the plante exparimsuted upon.

A Drawing of a Model of a Blenheim Orange Apple, which, with four other, received the Banksian Silver Medal at the 0 atober meeting of the London Horticultaral Society in 1822, wae exhibited at the recent Oxford Caryanthemum and Frait Show by Mias Swank, niece to the late Profeanor Wrstwood, Walton Manor, Oxford. The drawing was accompanied by the following history of the origin of the Blenheim Orange Apple: "Mr. G. Kempster, who lived at the end of the lant centary at Woodatock, when a young man, ditcovered a plant growing in a crevice in the windowsill. Ho carefally removed and planted it. In due time it became a tree, and bore Applee, which were at firt called K9mputer Pippins, and which were so fine and of auch excellent flavour that they soon became famoun. In 1811, Mr. Whitmant, gardener to the Dake of Marlboroder, placed some on his Grace's table, and the Dake so highly approved of them that they were thenceforward known an the Blenheim Orange. The original tree was standing in 1826. Oa September 21, 1822, five Apples were gathered from it weighing from 15 oz , to 214 oz , and measaring from \(12 \frac{1}{5}\) to \(14 \frac{1}{2}\) incher in circamference. They were exhibited at the October meeting of the London Horticultaral Society in 1822, and the Banksian Silver Medal was awarded to them. A model was made of the largest of these five Applor, which came into the pomession of the late Profemor Wkstwood." Gardeners' Magazine.

\section*{CORN.}

Averages. - Offcial statement of the average prices of British Corn, imperial measure (qr.), for the weel onding December 14, and for the comremponding period in the previon
 1894: Wheat. 20. 10d, Bariey, 21., bd. ; Oaty, 14. 2d.

\section*{HAY.}

Averages. The following are the averages of the prices at the metropolitan markets daring the past week:-Clover, prime, 80s. to \(95 \mathrm{s}\). ; do., inferior, 50s. to 70 c . i hay, best
 893. 6d. : and straw, 20s. to 42s. par load.

\section*{ENQUIRIES.}
"He that quertioneth mueh thall hagra mueh." -Bacos.
Perfecrion Tomato - A correnpondent。"S.J. B." writes:-"I have two hot-houses, 100 feet by 14 feet, with 5 feet br 3 feet beds down each side, and path between. I intend to crop these two houses with Tomatos. Piease tell me hiv I am to plant them in the bedn ( 5 feet by 3 feet). 0 a to obtain the greatest number of plants, yet not to overcrowd, so as to get bad cropa? Tomatos to be grown on single-rod system. Ought I not to be able to get five row in the bed ( 5 feet by 3 feet)?

Apples.- Will nome of our correnpondenta oblige "M. E." with the names of varietie of Apples which bloom late; and also lindly afford him any information concerning the times of flowering of Apple trees on grasa and on bare soil; or of methods of retarding the flowering beyond the nataral time, by keeping the grouad above the roots protected from March to May in some manner from sucheat

Azalea indica Leaves Browned: \(P\). \& \(S\). We should appose that the insects (thrip and redspider) were allowed to infest the plant in great numbere, and then that very heavy fomigation was resorted to, to rid it of them; or that the plant was dipped in over-atrong insecticide of somekind. The injury ia not likely to deatroy the plant, but it will cause the lose of the flower-bude.
Books: W. B. E \& F. Sjon, Booksellere, Charing Cios, Londor, W.C - H. Oram \& Sons. The Tomato, with Up to date Cultural Directions, by W. Iggalden. (Pablished at the office of Journal of Horticulture, 171, Fleet Street, London, E C )Young Gardener-How Plants Grow, Plant Life, Frwit Manual, by Dr, R. Hngg; Manual of Stove and Greenhouse Plants, by B. S. Wiliame; The Orchid Growers' Manual, by B. S. Willism: Horticultural Buildings, by Eawken; My Gardener, by H. W. Ward; Artificial Manures; How to Lay Out a Garden, by W. Kemp.

\section*{Chiswick Carol-}

What! Chiswick without Barron,
And Barron without Chiswick?
As well have a doctor
Without any phytic!
Chickets: W.W.C. Sprinkle powdered camphor or carbolic acid in their rune. If you can sink goodsized flowerpotr, having a piece of tile or blate over the moutb, and let the bottom of the pot be uppermats and level with the floor of the glasshouse you will hare a capital trap; and if some kind of odorous bait be placed at the bottom, so much the better. Crickete, having a penchant for exploring holer, will deacend by hundreds into these trap*, and not being able to get out will perisb.
English Therer Tress: T.D. G. The principal kinds planted are Qaercus mesilitiora, CF pedunculsta, Fagus sylvatics, Ulmas campestris; U. glabra, U. montana, Carpinus Betalus, Castanea vecta, Acer campestre, A. platanoides. Alsua glutinosap, Betala alba and B. nigra; Fraxinas exceltior, Juglans nigra, J. regia, Pupulas alba, P. canadenni, P. tremule, Salix alba, and others; Tilia valgaris, T. americana, and othert. Among Conifers, Pious aylvestrin*, P. Laricic*, Po austriaca*, P. Cembra, P. Pinaster*, Abies balamea*, Traga canadensis*, Psendotanga Duglasi*, Picea excela**, Abies pichta, A. grandiz, Cryptomeria japonics, Capressus nookatensir, Juniperua virginiana*, Larix europas*, Sequoia emperviren?, S. gigentes, Taxodiam disticham, Libocsdras decurren. Taose baving an ateriak attached are the commonly planted Conifert, but there is no reason why the others hould not be geaerally cultivated, being quick growers and the wood
asefal for many parposes. There are numeroas apecies of Pinus which might also be planted with advantage in these iolande.
Names of Plants: Correspondents not answered in this issus are requested to consult the next number.Mr. Cowles, Newport, U.S.A. The charactera agree with a plant in Herb. Kew, from Herb. T. Moore, marked Lomaria pibbs, crossed with Blechnom brailiense, Ryval Horticaltaral Society's Garden, Chiswick, 1876 - L. B. G. Cypripedium \(\times\) Eirmannianum (Harriniannm \(\times\) Boxallii. - Wishes to Know. Your apecimen of Calanthe, jadging by your description, is one of the best.-G.B. 1, Maxillaria rabescens ; 2, Croton Weirmannii ; 3, C. Johannia; 4. Dracæoa ferrea: 5, Diacæа regale ; 6, Dracana amabilis.
Obchid Collectina: R. S. Of course, it it beset with dangers of many kinde. We would advise you to read the Orchid Seekers, by Anhmore Ranana and Frederick Boyle; and About Orchids, by F. Boyle, pablished in 1894 by Cbapman \& Hall. Both books were reviewed in our insat for January 13, 1894, p. 47. You will find mach information about Orchid collecting and collectora at ppo. 335,422 , and 487 in the present volume of the Gardeners' Chronicle.
Peach Ro,ts: C. L. C. Very likely the knobs are the reault of some injary by a digging-fork or by frequently palling op the suckern. The knobs are often clacters of buds ready to atart into growth when circametances are favourable.
Retarding of Lily of the Valley Roors: Constant Reader and W. G. This is doue by large cultivators of the plant, bat the exact method we are unacquainted with. The roots are maintained at a low \(t \in m\) peratare (not frozen) all throagh the sammer and autumn-probably in the ac-called cold atorage places.

\section*{THE CARDENERS' CHRONICLE}

\section*{PUBLISHER'S NOTICES.}

Gardenkrs' Chronicle Trlegramb. - The Registered Address for Foreign and Inland Telegrams is "Gardchron, London."

\section*{ADVERTISEMENTB.}

SCALE OF CHARGES FOR ADVERTISING
HRAD LINE CHARGED IS TWO.
 ASD GIXPENGE TON EVERY ADDITIOMAL LIME.
If set across two Columns, the lowest charge will be 20s.
It set acrose three Columns the lowest charge will be 30 . Page, e8: Halt Page, \&4 104.; Column, e3.
Gardeners and others Wanting Situations. 26 words, including name and address, 18. 6d., and 6d. for cvery additional line (about nine words) or part of a line. These Advertisemonts must be prepaid. This scale does not apply to announcements of Vacant Situations, which are charged at the ordinary scale.
Births, Deaths, and Marriages, 5s. each insertion.
Position.-Advertisers are specially requested to note, that under no circumstances whatever can any particular position be guaranteed for advertisements occupying less apace than
Notion to ADVBrtisers.-In many instances Remittances in Payment of Repeat Advertisements are received without name, address, or anything beyond the postmark on envelope by which to identify the sender; this in all cases causes a very great deal of trouble, and frequently the sender cannot be identified at all. Advertisers are requested when Remitting to give their Names and Addresses, and also a Reference to the Advertisements which they wish repeated.
Postal Orders. - To Adverisers, Subscribers, and Others.-It is very important in remitting by Postal Order that it should be filled in payable at GREAT QUEEN STREET, London, W.C., to H. A. Stratton, as, unless the number of a Postal Order is known, and it has been made payable at a particular office, and to a particular person, it is impossible to prevent any person into whose hands it may fall from negotiating it.
N.B.-The best and safest means of Remitting is by POST-OFFICE MONEY ORDER.
Advertisements for the current week mosT reach the Office by first post, Thursday morning.
all Advertisoment should be addreased to the PUSLISHER
Publitahing Omce and Omee for Adverthomantr, 41. Whindent Staket, Sthand, W.C.

\section*{SUBSCRIPTIONS.}

All Subscriptions payable in advance. The Onited Kingdom, 12 months, \(15 s . ; 6\) monthe, 7s. \(6 d_{0}\); 3 months, 38. 9d. All Foreign Subscriptions, including Postage, 17s. 6d. for 12 months. Post-office Orders to be made payable at the Poot-office, Great Queen Striet, London, W. C., to H. A. Stratton.

Subscribers who experience any difficulty in ob. taining their copies regularly, are particularly requested to communicate with the Publisher (in cases of delay in the delivery by poart, the onver should be forwarded with complatnt).

FLORIST.-Man, thoroughly experienced in London references.-H. H., 3, Bear Street, London, W.C,

R
REAPING and SOWING are the two most 1 important periods in the life of the farmer, and granting that all circumbtancea are favourable, he naturally, during
the latter period, hopes to get an adequate return for hia the latter period, hopes to get an adequate return for hia
Labour. As he sows, he expects to reap, and unless constant labour. As he sows, he expects to reap, and unless constant
incuatry has been exercised, the harvest is generally a poor one. So it is wilh regard to bealth, if we are not constantly on the watch and destroy the germs of disease as coon as they on the watch and destroy the germs of disease as soon as they
are discerned, the body becomes weakened. and at last is unable longer to refist the attacks of the enemy. HOLLOW A Y3 FILLy destroy even the most minute traces of disense, by purifying the blood and strengthening the aystem.

\section*{B. S. WILLIAMS \& SON'S STERLING} NOVELTIES for 1896.

\author{
Our own introduction-now offered for the first time.
}

BEAN, DWARF FRENCH, WILLIAMS EARLIEST OF ALL
(Novelty 1896). tivat on. It can be forced a good deal earlier than any ouher variety. It is a splendid variety for pot culture as well as for outdoor work. It gr ws from
18 to 24 inches high, is a strong vigorons grower with 18 to 24 inches high, is a strong vigorons grower with a good constitution; the pods are log, broad, and
fleshy, and of a green colour. They are very tender fhen cooked, and of excellent flavour. Specially recommended for very early forcing or for general crop. Per packet ( (12 pint), 1s. 6d.
TOMATO, "Warrior" (Novelty 1898). This magnificent variety is a very free setter and
pood cropper, producing its fruits in great clusters. good cropper, producing its fruits in great clusters. The fruit is large, round, and without ribs. The flesh is of a crimson colour, firm, with flavour of the finest quality. As the fruit is exceedingly symmetrical in
shape, it will prove very valuable as an exhibition
variety variety. It can be specially recommended either for
indoor or outdoor culture. Per packet, 18.6 d .

\section*{NEW GIANT PRIMULA. PRIMULA SINENSIS FIMBRIATA "MAGNUM BONUM." (Novelty 1896)} This beautiful variety will form an excellent companion to the Giant White Primula, "Snowball," we sent out last Year.
was raised by Messrs. \(J\). \(J\). Hayes, Edmonton. We have every confidence in placing it before our Customers, feeling confident that it will become as popular as our Giant White variety. The plants are very sturdy and compact in habit; the flower at em is strong, and rises well above the strong, robust foliage. The blooms are produced in great profusion, of a gigantic size, beautifully Iringed, and the colour is a very beautiful shade of a rich deep red. Per packet, 5 .
ILLUSTRATED SEED CATALOGUE for 1896 is now ready, and will be forwarded, gratis and post-free, to all applicants.

SATURDAY, DECEMBER 28, 1895.
}

PRESERVED FLOWERS, GRASSES and Leaves for winter.
BUT few flowers are preserved, beoanse so D few present that thickness of petal whioh enables them to undergo the prooess of drying and dyeing when necessary. Chief among them is the Helichrysum, a flower that needs bat little dyeing, as if cut at the proper season, and carefully dried, it retains a good deal of its clearness of tint. Amateurs who preserve some blooms, and are desirous they should possess a greater brillianoe, may employ Judson's dyes, and in the same way give to their dried grasses a decorative value, albeit unnatural. Germany supplies the great bulk of the dried flowers which come into the London markets in autumn.

Acroclinium represents but a small bulk the petals lack fibre; they are thus of an evanescent character. The same applie to Rhodanthe. The most valued is the pretty Helichrysum vestitum from the Cape, known an the Cape flower. Some say it is not a Heliohrysum, but no one disputes its usefulness. The Cape flower comes over in very large balk, very largely undyed, though a few appear in atriking colours; they have proved especially valuable for charch decorations. Fairy flowers are made from the silken down taken from some Asclepiad, and reversed by tying closely together the upper portions of the silken hairs, they then form a perfect ball. These are collected by children in certain districts, largely in the northern parts of Canada, and are known as milk-flower balls. They, too, are maoh employed in ohnrch decoration, and for the better-class bouquet work.

The homaly Gnaphalium comes to us from France, where they are much grown and employed for wreaths and funereal ceremonies; they are bleached and then gaudily dyed, but few retaining the natural tint of ivory whiteness. A few years ago they were our only dyed flower. Attempts have been made to preserve other flowers, but most of them have proved too fragile to be of permanent service.

Grasues are largely employed, and some of the finer examples of recent introdaction are really superb. Many of the most popular grasses come from Germany. Eome take the dye without the preliminary of bleaching; some have to be bleached. Many are undjed, retaining their peouliar tints. Agrostis is one but now very little used. The Oat genus supplies many; the higher forms which find a plaoe among our ornamental grasses are not very useful, exoept in buoches. Of the common Oats some large imported types appear the most useful; s bigeared Oat comes from the northern parts of Italy, and when fully expanded, the husk oomes away,
and a greater decorative value is therebyacquired; the Oat takes the dye well. Some of the rich bronzy-dyed heads are very handsome. Biomus is perhaps the most largely used generally of any grass, being so pretty and useful, and the Quaking-grass (Briza) is always very popular ; so are the smaller forms of Chloris.
The popalar taste goes ont to the tall and stately grasses such as the Congo or Niggergrass, a reed-like type growing in the swamps of the Congo, the flowers in small bonches making up large ball bouquets. The Elephant-grass is in its oharming silken appearanice one of the appearance of berries [?]; it is very useful for the most attractive in the form of its infloresoence; tall-growing form with long stems from the Gold Coast, assooisting well with the preceding. Eulalia is also very popular, and is imported from Florida, a beautiful tufty group, in long sprays, eight or nine of these sprays springing at intervals from the stem, and it mixes well with anything dyed or nataral. Erianthus is another popular grass, whioh is largely grown in Italy, and has a plumed head like that of the Pampas-grass, many of them as large as the smaller-sized plumes of the Pampas, but to be obtained at a considerably less cost. Lagurns ovatus, the Hare's-tail Grass, mostly from Germany, is a pretty one for mixing, bat a troublesome grass to store by dealers, for the mice find their way to it, tear the heads to pieces, probably in search of seeds, and baild nests for their young with the fluffy portions.
Uniola is one of the most nseful of the larger grasses, the heads on long stems, and a mass of spikelet-most useful, whether in its natural tint or ooloured. This grasis comel from the swamps of the Mississippi river.
But the Pampas-grass commands the largest sale. Messrb. Oaman \& Co., of Commeroial Street, E., get through in a season from 130,000 to 150,000 heads, out of that number dyeing a very large proportion. It is in the greatest demand, which is, perhaps, not surprising when its extremely showy oharacter is considered. Enormoas quantities come from different parts of America, largely from St. Louis in the West, and from the North also. A fine companion is found in the Uva-grass, with very handsome feathery plumes on long stems, most valuable for the deooration of halls, and the corners and nooks of large rooms. The plumes come from Brazil.
A magnificent new grass is found in what is termed the "Paradise Plume," a recent introduction, the plume somewhat resembling that of the Pampas, more divided, and of greater length. This is considered the most elegant of all the long grasses which are now imported.
Palm leaves of various kinds, imported in a dried form from Germany, British Honduras, \&o., are received perfectly flat and rigid, and so become suitable for forming backgrounds to large bouquets; Areca, Chamædora, Latania, Cyeas, \&c., are the leading forms. The leaves of Cycas are hard and durable, but the jellow tint is rendered green by dreing. Phonix comes over with the leaflets compressed firmly against the main rib; they are opened out, pot through a certain process, and curled, and are strikingly handsome. Bulrushes come from many parts of the conntry, and in different varieties; the main thing is to colleot them before they are too far advanced, or the top will burst, and beoome disfigured.

Sea-weeds are largely employed, and are regarded as among the prottiest agents used in making up decorationi. In their nataral con-
dition the appearance is somewhat repulsive, and the smell offensive, bai when put through a certain prooess, and dried in various delicate shades, they are most useful. They are dropped into vases, to form the groundwork of bouquets, \&c. These plants are oolleoted in various places along the coast of Pennsylvania.
But quite a new development in the utilisation of these dried leaves of Palms, \&c., has come to the fore of late, namely in the renewing of these sun-burnt leaves so that they again become a vivid green, and then building them up into stately plants so like to nature as to pazzle oasual observers. The leaves are passed through a certain process to render the material sapple, they are then ironed, coloured, and fixed to oleverlyimitated trunks, and so a fine speoimen Latania, Areoa, Phoenix, Cyeas, \&c., is built up in a short time, apparently so full of life and so perfect in health, that it is not surprising that these artistic forms fashioned with singular fidelity to nature are well adapted for ornamental groups, filling ansightly corners, and for furnishing entranoe-halls, lobbies, stairoases, \&o. In hotels and restaurants they prove partioularly valuable -they do not fade, are proof against excessive heat and cold, require but little attention, and are supplied either with the leaves permanently fastened to the stem, or so fitted that they oan be readily removed for cleaning, for whioh parpose a damp sponge will be found effectual. In this form the stems are provided with the necessary apertures in whioh to insert the leaf-stalks. Several very faithfal counterparts of Dracæna australis, Thrinax parvifolia, Phoenix daotylifera, Cyoas revoluta, and others, are on view, and seeing that they can be parohased at a considerably less post than living plants, it is not to be wondered at they are becoming much in demand. Messrs. Osman \& Co. are foremost in introducing novelties, and they are to be complimented upon this latest addition to their extensive display. R.D. TThe botanioal details of some of these plants require investigation. The names given above are mostly trade-names. Ed. 7

\section*{New or Noteworthy Plants.}

LeLIA \(\times\) FINCKENIANA VAR SCHRODERA, nero nat. hyb. (L. anceps alba \(\times\) L. albida).
Thes type apecimen which bore nome rememblance to L . ancep: Dawsoni, even to the parple marks on the iide-lobet of the lip and the crimson blotch on its front lobe, was illustrated in the Gardeners' Chronicle, December 30, 1893, p. 804. The plant more nearly reaemblea a strong \(L\), albida in ita growth, and in the form of its labellam, whose aide lober do not clip the colamn. It bears evident traces of that species, and contequently there is little doubt that the parentage impnted to it is correct. And now a beautifal pure white form, with the exception of a few thin purple lines at the base of the lip, has appeared in the collection of Baron Schroder at The Dell, Egham, and form a fitting abject to name in compliment to Baroness Schroder, who, like her hubband, take: a keen interest in Orchida. L. \(\times\) Finckeniana var. Schrodero ir, in every reapect, aimilar to the original planf, except that it has pure white flowers, and no crimon bloteh on the lip. James O'Brien.

\section*{Orchid Notes akd Gleanimas.}

\section*{SCUTICARIA STEELIL.}

Foi a period of about four week we have hed this apecies of Orchid in flower. There are aeveral poenliaritie noticeable in the plant not observed in

Orchid generally. It blooms at the dullest time of the year, it fragrance is delicious, and, lantly, the flexible leaven, 3 to 4 feet long, having the thickneas of a goonequill, are aingular-looking. Oar aptcimen has two very short flower-acaper, each carrying three flowers of about 3 inchen in diameter. The epala and petale are of an oval form, and of a very fine soft yellow colonr, blotchad with browninh-purple: the labellam is three-lobed, and of a cofter yellow tint than the petals. As the plant shows a few of these splendid flowers every year, we think it is doing well. The plant is fized to a piece of cork, with sphagaum and peat placed about the rootr, and is hanging near the glase. Scaticaria Steelii was imported into Earope in 1836 from Brazil and Sarinam. It is a specien worth adding to any collection of Orchids. J. \(\mathcal{K} \cdot B\)., Utrecht.

\section*{Cattleya labiata-albinos.}

Among the tens of thousande of Cattleya labiata original type, introduced within the latt few years, comparatively few albinos heve been seen; indeed, white Hower of any pecien, of which the typical form is coloured, are rare indeed, and yet we do get an occasional white, one in C. Mossix, in C. Trianæi, in C. Mendeli, in C. Gaskelliana, even in C. apperbum, and in C. Aucklandiz, and some other apecie and aub-apecies. It is pleasing to see, after all these year of waiting for C. labiata, that we have got a aperabundance of it, and amongat the lot have come everal with white flowers. Oae of the beat that has come under my cogniaance is now in flower in the very choice collection of E. S. Ball, Esq, of Earlacourt, Bowden (gr., Mr. Alezander Hay). It is a fair-nized flower, with eepal and petals pare white, without a shade of colour, as I examined it with the eyen of a severe acrutineer. The lip is also white, with the exception of a momewhat irregular lemon-coloured blotch towards the base of the column. The column is also white, and the lobes of the upper portion of the labelkim are folded back, showing it fally exposed. The lip is more apoon ohaped than circular, like the typical form in outline, and the whole flower is chaste and beantiful. There are two flower on the plant apringing from the labiata typical aheath, and the plant is atrong, having five leafy bulby. It is one from an importation gathered by the collector, who asw it in flower, and labelled it; and a credit it is to him, for it has turned out in every respect according to the description sent home, that variety flowering for the first time in this conntry.

In thim collection alno is another albino, having the amme purity of aepale and petsls, bat with the lower extremity of the lip flashed and lined with the softeat sheen of pink. This, on the white ground surrounding it, and contrasting with the white segment, maken a beantiful flower, somewhat like the one exhibited by Mr. Measures before the Orchid Committee. This one is dedicated to Mr. Ball's consort, and bears the name of C. labiata alba Ballw. It differ from the white Cooksoni in having white round the labellam, Cookeoni being aolid, beautiful cerise lip, with by far the bet formed white sepals and petale of any yet aeen. J. A.

\section*{FLOWERS AS FOOD.}

In this country, with atuodance of cheap food, we are astiafied with flowern for decoration or ornament to our tables, but in many foreiga countries they absolutely serve as food. It is rarely that we find the corolla of a plant werving any other purpose than as a temporary protection for the reproductive organs within. Bat for a flower to secrete more than half it weight of augar, and thu: become an article of economic value, and even of commerce, is remarkable. Of this, however, we have an instance in the flowers of the Bassias of India.
Mere fugitive atructure for the mont part, their transitory purpose precludes the plant wasting upon them aos of itw atore of reverve materials. In Iauia, the young flowers of the Banans are regalarly eater, and in China they are pickled in vinegar. Precesyod Mahica, or Mowhara, foweri constitato an important
article of food to the aboriginal triben of India: The fleshy now-white flowers are produced in enormous quantities in March and April. They fall off and cover the ground benesth the treea, and are gathered eagerly by the native during the fowering aeaon, and eaten either raw or cooked. A single tree will yield many hundred-weight of corollas; these are eaten, as a rulp, once or twice a day by the poorer classes of the wild tribes of central India, and in parts of Bombay, Rajpootana, and Bengal. In Moonghay, mouth of the Gangen, there are about one million Bassia trees, so that the yield of flowers there annually cannot be far short of 100,000 tons.
The blomams of another apecier, Bassia longi-
in Egypt is from a hard conuerve of Violets made by pounding the flowerf, and then boiling them with angar. This Violet aherbet is of a green colour, and is called "the grand Signior's aherbet." Tho petals of flowers are much uaed in Roumania, in flavouring preserves; Violete, Lime flowert, and Rose petals are especially used.

Having regard to their flavour, delicate odoury, and agreeable appearance, the variety of confitures made there is almost infinite.
The flowers of Melianthus major are so full of honey that the natives of the Cape Colony, where the plante grow wild, obtain it for food by thaking the brancher, when it fall, in a heavy shower.

Fig. 129.- CYPRIPBDIUM insigne: With the upper and lower sepals amilarly spotid.
folis, are employed in a mimilar manner by the native of Mytore and Malabar, where it abounda; they are either dried and roasted, and then eaten, or braised and boiled to a jelly. The dried amall redpinkiah flowers of the Calligonam polygonoiden, known in India se "phogalli," are eaten by the poorer clases, made into bread, and cooked with ghi (a fluid butter), or caten separately with ast and condimente. The flowers having fallen off, are awept up from the zround, and aued largely an food. The flowers fill the air with a pleasant odour, as of over-ripe Strawberrien. On apalyais they are found to contain about 46 per cent. of sugar, and 167 of albuminoid.

The Romane bad a wine made of Violet flowers, and thene flowers are still uned in Turkey in the propliation cf therbets. The mont enteemed aherbet

The blosems of the Shaddock are used for flavouring wweetmeats. The calyces or flowar-bracts of the Roselle or Indian Sorre), as they ripen become Glesby, and being of a plessant acid tnate, are mado into tarte and jellies in India. Roae-bude are eaten by the ladies of Arabia, boiled in angar; and made into a preserve.

In Chins also dried Roses are ased as a condiment. At Grasse in France, all the old and atale Violets are diaposed of, chiefly to manafactarers of confections, who ateam and coat them pretty thickly with flaked ugar, and then sell the confections at a high price as "confitures of Violetr."
The beautiful bright red flowern of Qumaia amona are valued in Jamaica for their atomachic properties infused in wive or water; evary part of the tree beiog bitter. The flowers of apecies of Lily. Hemero-
callis graminea and fulva, and Liliam Thunbergi when dried, constitate one of the choicent delicacies of the Chinese kitchen. They are ured to sesson dishes, ragouts \&c. There is a considerable trade in thene Lily flowern at the different Chinese treaty ports, amounting in some instances to 73,000 ewt., as at Chinkiang in 1893. The ports in which the commerce is chiefly carried on are Hankow, Chinkiang, Shanghai, and Wychow. In \(1890,5400 \mathrm{cwt}\) 。 of these Lily flowers were sent from Hong Kong to Macao. These flowers, plucked shortly before blooming, are grown in many provinces of China: those from Shantung and Honan are eapecially eateemed. When cooked as a vegetable, they have an agreeable odouriand aweet tante. They are much uned in the ascrificer offered to ancestore by the Chinese.
The aromatic apice, Cloven, are the dried calyces or flower-buda of Carophyllan aromaticus. The petale of the flowers of Anona wenegalensis are used on the Niger for flavouring dishes. The Turks prepare a cooling drink from the flowers of Nuphar Inter.
Another use of flowers is in the form of anffron, the dried atigmas of the Crocus, which has been highly prized from a remote period as a condiment. Although not much used here for colouring and flavouring food, it is largely employed in India.
The imports of these were 339 cwt . in the financial year ending Marcb, 1892, valued at \(£ 60,272\); and in \(1894,317 \mathrm{cwt}\)., value \(£ 56,014\). The value of the import thum often exceed \(£ 75,000\). The atigmas are the only uneful product of the flower, the reat being wate, and of these it takes some 70,000 to produce a pound of afffon. Saffion is largely grown in France, Spaiv, Italy, Germany, and other parts of Earope, and is also produced in some parts of Avia, Chins, Japap, and Tanis. It in used by "liquoristes" and confectionery, and alao to colour cheene and batter in Europe. Saffron-cake is a pastry coloured and flavoured with saffron,
The capers used at, our tables are the flower-bude of Capparis spinoza, employed as a pickle in vinegar, or of Zygophyllum Fabago, which latter are occasionslly aubstituted for them, Another anbatitute is the unripe fruit of the garden Nasturtiam (Troprolum majue). About two million pound of capers are collected annually in the south of Earope. Primroses are excellent in slad. Cowalip flowert fermented with sugar form a domestic wine, and are also used for a baleamic drink, known as "paigle tea." The dried blonsoma communicate an aromatic fracrance to home-made winet; resembling Mascatel.
The flowern of Meadow-wweet (Spirsa Ulmaria) are also used by wine merchant to improve the flavour of home-made wines. The youvg calyces of Dillenia apecioma are added to carries in India. The flower-bude of Bombax heptaphyllam are cooked with ealt and pepper, and eaten by the native of India. The flowera of Abutilon esculentam, an edible, at their apecific name implien. The fowert of the common Marigold were formerly used in brothe and soups, bat are now little regarded, P. L. Simmonds, F.L.S.

\section*{CYPRIPEDIUM WITH PELORIATED SEPALS.}

Pelonita, or the development in a regular and uniform manner of parte that sre uaully irregular, is most common in the corolle. In the calyx, or outer whorl of the flower, it in les common. Still, we do not know how better to clasaify the flower of Cypripedium insigne exhibited by Mr. Tate at a recent meeting of the Royal Horticultural Society. The appermost aingle aepal, and the lowermont which conaiats of two in combination, were both characterived by the white tip and the parplishbrown spota that uwally characterise the apper nepal only (nee fig. 129).

Other flowers on the same plant showed intermediate condition, and it will be interenting in the future to note whether all the flower will anume the characteriatic coloration and apotting. Should thoy do 40 , the gain will be great.

\section*{OUR POULTRY \\ By Harbigon Weir. \\ (Copyright) \\ (Continued from p. 489.)}

Theras are many more varieties of French fowls besides thone mentioned, but an table-fowla none anporior, and many not so good; mont have "a halfbred look" boot them, anch as the Faverolles, La Brese, and others. Some of the best are a black breed that I saw at St. Serran some time ago; but these were far excelled by our own Dorking, the old Kont, Sassex, and Surrey breede. I do not mean thowe now reared in these connties for market purposet, but thone no carafully bred and tended nome forty yeart since, and which may be again reprodaced by careful matiog and selection and ae carefully avoiding any contact or mixture with the Shanghai or Cochin, or what is termed the Bramah ; all these are grone feeders, large-boned, and carry more offal than any of the Earopean varieties. And yet for all this, moot of the mongrel-bred now breeds generally have a Cochin or Axiatic basias, for the one reason-because they look bigger and heavier, with their large bones, fluffy featherg, and fall round abdomen. Still I am hopeful that the general public is being educated, though alowly, as to what is really a good table-fowl. It is, indeed, antprising with what persistency even poaltrykeepers cling to the coarae, large, ill-shaped mongrel, in preference to thone of almost a perfect aymmetry, and of high quality, with an even diatribation of flesh and fat on the breat and without an undue quantity of inward, and therefore, as a rale, wasted fat.
In the beat Kent, Sussex, and Surrey ahort, whitelegged fowls, of medinm weight there in generally great excellence, and the short-legged, aturdy old Eaglish game fowl provides the perfection of a moderate-sized bird, fatting eveniy, fall of fleoh of the mont delicate Aavoar, with a ninenem of tianae unaurpassed by any other. And of these the white legged, black-breasted rede are deemed to hold their own againat all othere. The mach-vanated Indian gamp, though somewhat larger, is by no mosins so good, acarcely ever fatting on the breant, having also more abdominal fat, and with heavier and larger boner, besidee which they are worse layers than any other breed, with the exception of the Malay. The old Eaglish game is again coming well to the front, and that it in rapidly rising in the public eatimation is abandantly proved by the very namerons entries at the late Poultry Show held at the Cryatal Palace.
Though averse to crose-breeding or crose-bred fowls as a rule-and this for the reason that some of the most noticeable kinde of the pure breeda are ao oxtremely good, this cronaing with others maot have a tendency to depreciate instead of enhancing those good qualitien which they already possens-atill, as there exiats the eraving for crousing which is, Ithink, mont peraicions, and one that is not to be found among the breeders of cattle or sheep when once the trae breeds can be got; therefore, it would be well to note some of the meny cromes that have been tried with more or lene ancesas.
Firat, there will be considered the king of fowle, the best of table-fowle, the old English white-legged game. Here you atart, an nearly as possible, with the perfection of a table-fowl, no part being out of dae proportion to the reat. Therefore, if a larger bird is wanted, the undoubted best and mout natural croun would be either the Dorking, or the old Kent, Sanex, and Sarrey. Hare you get size with quality, and at both are active, good rangers and foodreekers, the young will gain much of their living by their own exertions, besiden which, this exercite also errves to make them more mascular, hence more flesty, and even causes them to put on fat, and yet to keep in a healthy condition, anlike thome that are cooped and crammed.
Next to this erose is that of the Iadian (so-called) game with the Kent, \&ec, which prodaces a larger fowl, with a long, and generally a lean breast, the fibre of which in close, short, and somowhat dry, the fat generully being about the belly, with mueh
internal fat. I have known more than 2 i 1b, to be taken out of the inside of fowle of this crose when preparing them for the cook yet they reach the ideas of aome as what in a good table-fowl, being of a large size, and nice appearance to the general obnerver.

\section*{VEGETABLE MARROW}

Tir Vegetable Marrow, of which we give an illustration (6g. 130, p. 765), was obligingly went us under the name of Courge Patate by our honoured correnpondent M. Caarles Nandin, the Director of the Garden of Acclimatimation at the Villa Tharet, Antibes. The drawing gives an excellent idea of the size and form of the Marrow. The flesh is yellowish, very firm, and is "very good cooked." The plant is a climber, and prodaces abundance of fruit. It will, saya M. Naudin, succeed in England. We do not find the name in M, de Vilmorin's Les Plantes Potagères.

\section*{THE LIMES (TILIAS).}

Tere confuion which hat overtaken the nomenclature of nearly all the more popular hardy treen and shrabs is ehared to the full extent by the Limes. In the List of Hardy Trees and Shrubs insued from Kew in 1894, which, it is hoped, will become the accepted atandard of nomenclatare for this divition of cultivated plants, about twenty apecies and varieties divide between them nome seventy to eighty eynonyms, many of which are in carrent nse. In the hope that it may be of some help towards the adoption of a more uniform and correct naming of theae trees in Eaglish gardens and nurserien, I have, in the following noter, enamerated the pecies and most of the important varieties in cultivation in Britain, with a description of their more essential and distinctive charactery. Whilet the hybrids and intermediate forms which conneet several of the apecies are often puzzling to identify, the leading typen, with flowering and fruiting material at hand, are not difficult to diatinguish, and these, of course, are the mont important in the eatablishment of a aniform nomenclature.
Tilia ia a parely north temperate genu (not represented, howevar, in North India or Wentern North America). About fifteen speciem are known, eleven of which are in cultivation at Kew. Most of them are lofty trees producing a moft, white, and usefal timber. They have a tough inner bark from which, in the case of the North Earopean apecies, ropes and the well-known Bast mats are made. The leaver are alternate, uaually more or leas cordate in outline, and oblique at the base. They have a somewhat diatichous arrangement, and in joung trees there is frequently a flat, wall-tree-like arrangement of the branches. The flowert are alwaya of some thade of rellowish white, and fragrant; they are produced on a peduncle which for half ita length is united to the mid-rib of a membranous, pale or jellowish-green paraistent bract, from the middle of which it appears to apring. In the American apecies, ia T. argenten and T. petiolaris among the European apecies, and in T. Miqueliana and perhaps other Asiatic apecies, the stamens are joined to petal-like scales, which are absent in the other apecien. The fraite are amsll and nut-like, rarely larger than a small Pea, varying alightly in ahape from globose to ovoid.
As ornamental trees in Britain, the Earopean Limea have proved by far the mont valuable, being hardier and freer-growing than the American or Asiatic ones; one or two of the best of them, like dasyatyla (euchlora) and petiolaris, are not no much planted as they ought to be. They might, from conaideration of both beanty and variety, to nome extent, at any rate, replace the common Lime in gardent and parkt. All the Limes like a fairly rich and moist loam, bat they succeed better than many trees do ou poor moil, at is shown by those at Kow; in the latter cave, however, they are very auceptible to drought, and after a dry summer lose their foliage very early. They ere propagated by layers, suckern, and seed, and in the
case of special varieties, by grafte. They are aubject to the attack of various gall-making and other intects, mitee, red-Epider, \&c. Thera appears to be no practicable means of combating them in the case of large trees, but healthy trees seem to withetand the sttacke of most of them without eerions injary. A solation of soft-soap and petroleum would probably be effective on apscimens small enough for it to be applied. Few trees respond to the pruner'i hand more quickly than the Limes. The chief point is to obtain and keep a single erect leader, and as long as the top of the tres is within reach, all rival ones should ba stopped. Where the trees how a tendency to develop into too buthy and spreading a form, the side branches ahoald be shortened back, so as to force the tree upwards. With Limen it is easy to do thir, and yet retain the nataral and informal outline of the tree.
The following is a list of apecien and chief varietien, with the better-known aynonym:-

\section*{Europran.}
T. cordata, ayn. T. ulmifolia, T. parvifolia, T. microphylla.
T. valgaria, ayn. T. intermedia, T. europæa. var. caucasica, syn. T. intermedia var. cancasica.
T. platyphyllos, gyn. T. grandifolia, T. cordifolia, T. europæa.
var, asplenifolia, ayn. T. laciniata. var. aurantia, syn. T. europæs aurea. var, Blechiana. var. obliqua, syn. T. Beaumontii. var. oxjcarpa, syn. T. cordifolia, var. oxycarpa. var. tortuona. var. vitifolia, ayn. T. vitifolia.
T. argentea, ajn. T. tomentoas, T. alba.
T. petiolaria, ayn. T. alba pendula, T. argentea pendula, T. americana pendula.
T. danyityla, ayn. T. auchlora.

\section*{American.}
T. americana, syn. T. canadensic, T. glabra.
T. pabescens, ayn. T. americaus var. pabescens.
" " var. leptophylla.
T. heterophylla, syn. T. americana var, haterophylla.
T. mexicana (not in cultivation).
T. mandechurica.
T. Miqueliana.
T. cordata (same as Earopean species),
T. Henryana.
T. Oliveriana. \}not in cultivation.
T. Tuan.

The three cultivated American species are figured in Sargent's Silva of North America, t. 24-7.

\section*{Europran.}
T. cordata,-This Lime, which in now admitted to specific rank, is one of the three leading forms which formerly conatituted T. europma-a now obsolete name. It may be distinguished from the other two (T. platyphyllon and T. vulgaria) by the following characters: It is a mach maller tree; ite leaves are maller and glabroas, with the exception of tult of pubescence in the axile of the nerven on the lower aurface; lastly, it flowera later in the aeason than the other two. It is found wild in Britain, although sparingly; of thene three apecies this has the most northerly habitat, the sonth of Britain being about the lowest latitude in Europe it naturally reachen, but it is also a native of northern Asia. It is a tree of compact and handsome growith. The leaver are 2 inches or occasionally more in width, and of the same cordate ontline as those of T. vulgaris. The flowers are like thowe of the common Lime, except that they are amaller; they are produced in great ahandance daring July.
T. vulgaris.-This is the common Lime or Linden, and is by far the most sbundant of all the species in the gardent and wood of this country. As has already been stated in connection with \(T\). cordats, this apecien was, along with that and T. platyphyllou, formerls grouped ander. T. europas. It is intermediate between the other two in meveral
reapecte, viz, in aiz of leaf, in the degree of pubercence on the leaf, and in the time of flowering. It is well to remember there points of diatinction, bat in other respects it is so well known that it in needless to dencribe it. It is a lofty tree in Britain, of somewhat pyramidal shape when young, but roundtopped when old. There is one tree in the Arboretum at Kew just over 100 feet high-the tallent tree in the gardens.
T. platyphyllos.-This is the most nouthern of the three Limes, which used to be united under the comprehennive term of T. europæa, Although it is joined to T. valgaris by intermediate forms, probably of hybrid origin, it may, in it typical condition, be recognised ( 1 ), by being the firet to flower ; (2), by it broader and larger leaves; and (3), by

Kew, and the variety in now eatablished under this name in the collection. Ite peculiar character is an marh marked af ever, some of the brancher almont forming loops. It is not, at wat at first anmised, due to injury by insect (see report of Scientific Committee, Gard. Chron., 1888, ii., p. 708).
vitifolia.-Leave of more triangular outline, and with somewhat Vine-like lobing.
T. argentea. - This fine and atriking Lime hav been in cultivation in Britain aince 1767. Loudon, who describe it as T. alba, arys it is a native of Hangary, and looky upon it as a variety of the Common Lime. But it is at least at diatinct as aeveral others now given apecific rank. It is not so large a tree ae T. valgarin, rarely exceeding 50 feet in height. The leaves are unequally cordate, or almont trancate at

its leares being pabescent usually on the whole of both surfaces, but always on the lower one. There are numerou garden varietie of this apecien, among which the following are the most distinct:-
asplenijfolia, a tree of very much less vigorous growth than the type, with laciniated, irregularly lobed leaves.
aurantia.-A form dietinguished by the rich jellow bark of the young thoots.

Blechiana.-A atrong and vigoront tree, with leaves of exceptionally large nize.
obliqua.-Han markedly oblique bate of leaf. It is aloo known as T. Beanmonti.
oxycarpa. - With coarsely-toothed leaven and prominently fire-ribbed fruits.
tortuosa.- In December, 1888, Mr. G. Swailes ment a young Lime with curiously curved and twinted branchen to the Scientific Committee of the Royal Horticultural Society. Some graft were ent to
the base, 3 to 4 incher acrom, the upper aurface dark green and glabrous, the lower one of a beantiful silvery hue, which given to the tree, eapecially when a breeze is blowing, a conspicuous appearance. It is of erect, atardy habit, the fruit being ovate, mooth, and traversed lengthwise by five raired lines.
T. petiolaris.-For many yeari the identity of this meciea was very obacure, at may be guensed from the atring of nyonjmi given above. In some respects, notably in the ailvery ander-aurface of the leaf, it resembles T. argentea, and it wan at one time looked upon as a pendulous variety of that apecies. In 1884 it was figured in the Botanical Magazine, t. 6737, and Sir Joseph Hooker identified it as the imper-fectly-described T. petiolaris of De Candolle. Is in a tree 50 feet or more in height, with rounded learer, having an obliquely cordate base, and measuring 2 to 4 inches in diameter. From T. argenten-the only apecies with which it is likely to be confounded
-it differ in ite graceful, pendent growth; in ite warted, alightly grooved fruits, and in the leaf-ntalk being, in proportion to the blades, twice the length of thone of T. argenten, a character of which the specific name, petiolaris, is a anfficient reminder. A native of Eatern Europe.
T. dasyityla.-Although at pretent bat little known in gardens, this in undoubtedly one of the mont valuable of all the Limes. It is of graceful babit and vigorous conatitution, bearing some resemblance in general aspect to T. petiolaris. Ite leaver, however, are not ailvery beneath, but green on both aidea ; indeed, the peculiarly luntrous green of its large leaven distinguishen it from all other apecies. They are heart-ahaped, 4 to 7 inchen wide, and of leathery texture ; the upper surface is glabrous, but beneath, tufte of brownish pabencence occur in the axilt of the veins. The bract on the llower-atalk in lanceolate, and the fruit ovoid and downy. This species is likely to prove valuable an a town tree. It is perfectly hardy, and retains its foliage longer than the common Lime, flowering in July. It is a native of the Caucasus, and has been under cultivation over twenty years. A First-class Certificate was awarded it by the Floral Committee of the Royal Horticultural Society in Augut, 1890. There are trees 30 to 35 feet high in the Kew Arboretum.

\section*{American.}
T. americana.-Although an exceptionally fine tree in North American foresta-where, according to Professor Sargent (Silva, tt. 24, 25) it is 60 to 70 feet, and occasionally 120 to 130 feet high-it has not proved a auccess in Britain, and cannot be compared in value to the East Earopean apecies. From these it may be diatingaished by its large leaves, which on young treen, at any rate, are often 9 iaches or more acrons. They are alightly and obliquely cordate at the bave, and they are glabrons, except in the axil of the veina beneath, which are pabeccent. Although this apeciee is not subject to injary by froat, ita brancher aeem very aubject to decay, and all the trees I have aeen are more or less crooked and flat-topped. The cleaneat-grown opecimen at Kgw is one labelled var. misaissippenais ; it is, however, worth growing for the striking dimension of its leaves. The fruits are ovoid, thereby dietinguishing it from the two other North American species, which have globose frnits. It was in cultivation at the Chelsea Phyaic Garden in 1752.
T. pubercens.-Whatever value as an ornamental tree this may have in the United Stater, it does nit aucceed well in Britain, It is represented in the collection at Kew by tree 20 feet high, but they have the same aneatisfactory appearance ae their near ally, T. americana. The following particulare are chiefly taken from the Silva of North Anerica, where it in figured at t .26 : It is nowhere ammon tree, but is most abundant in Sonth Carolins and Georgia, growing to a height of 30 to 40 feet. The leaves are 2 to 4 inches long (much larger on the amall tree at Kew ), pubeacent on first opening, bat afterwarde glabrous on the upper aurface. The mid-ribs, the peduncles, and the flower-buds are also pubencent. It was introduced into England in 1726. The variety leptophylla has larger and thinner leaver.
T. heterophylla,-From the two above-mentioned North American Limes, this is eanily distinguished by the nilvery-white under-an'iace of ite leaven. Prof. Sargent (Silua, t. 27) devcribes it an atree 50 to 60 feet high, and enyn that few North American trees surpans it in the beanty of ite foliage. The leaves, which are bright green and mooth above, are 4 to 8 inchea long, and the truncate or cordate bate are more markedly oblique than in either T. americana or T. pubescens. It was introduced in 1811, but is at present a very rare tree in England.

\section*{Abrattc.}

There in not much to be waid in regard to the Aviatic Limen, at cultivated treen in Eagland. T. cordate has already been dencribed among the European apecié, and the only others in our collections are T. Miqueliana and T, mandeharica. I heve not
seen any living T. cordata that has been introduced from North Asia, but jadging by the dried specimens in the Kew Herbariam they do not vary from the Earopean form any more than the latter do among themselves. The most obvious difference is that aome of them have leaves with a white under-aurface.
T. mandechurica.-A swall tree at Kew under this name in 12 feet high with a buthy head. It has thin, cordate, slightly obliquo leaven measuring 6 inches across, with aharply pointed, irregular teeth which are either atraight or curve alightly outward. It does not promise to equal any of the Faropean species in beanty, at least in the London district. It is very subject to injury by apring froste, and the branches have in consergence quite a pollarded appearance. The young bark and buds are at thil reason covered with a grey-brown tomentara. Professor Sargent, who describes and figures T. Miquelians in the Forest Flora of Japan, stat that the tree just described is that apecies, and not T. mandacharica. Bat so far as leaves go, the Kow plast agreen with Maximowicz's specimen of T. mendecharice gathered by himself in Acourland, and now preserved at Kew.
T. Miqueliana.-This apecies is a common forest tree in the northero parte of Japan, and it there attaina a beight of 100 feet. It is only represented by emall seedlings at Kew, and it will bs aome time before any definite opinion can be given of ite probable value in Englist garden. Maries collected it in Yexzo, and his specimen in at Kew. From it, it would appear to differ from T. mandschurica in the more incurved teeth of the leaven, the greater obliquity of their bases, and the more obvious whiteness of the under-marface. W. J. Bean, Arboretum, Kew.

\section*{NEW ZEALAND FRUIT CULTIVATION.}

In thete daye of heary importation of colonial and forelga fruite, is is a matter of some importance to growerk and alesmen at home to realise at nearly as posuble what they have to meet from their competitors in other lands; and thus it is that we take advantage of opportunities afrorded by the agente of colonien and foreign power reaident in the metropolin to place the desired information on record here. Very often the power to compete possensed by our "outside "friende is over-entimated-an in the case with the colony under consideration-New Zgalsnd. Oat there, growers were going to do all sorts of things with ell sorts of fruit trade-they have till to begin! In the matter of Applen, all sorts and uizos of frait were placed on our market, and served to prove an object-lesson of That to aroid planting and sending out as eatable. To-day, old trees are being up-rooted and re-placed by finer varietien, ach an are suited to Eaglish palates-the ame lesson ss wat so well learnt by our friend in Tasmanis and elsewhere. At present, the colony doen not even atinfy the cravings of attlers for tootheme fruit-by-andby they may bo ablo to week fresh field with a chance of auccens.
Thim year there are 21,400 acres laid down in orcharda-an increase of 313 acres on the area so returned in 1894. We misy insert here the fact that a great deal of fruit consumed in the colony find it. way from other Auttralasian colonien and the Pacific Islands. From the North Cape to the Bluff Hill, on the extreme nouth of the Middle Island, a large variety of fruite is grown, such as Peara, Plum, Qainces, Apricotr, Fign, Walsuts, Cherrien, Goomberries, Carrants, Strawberries, and Rapberrien, and produce large crops. In the Auckland district, Orangen, Lomony, and Limes flourish; many grove are now in bearing condition. The Olive flourithes in the North Ioland, and bearr heavy crops; and the manafacture of oil in gradually becoming an important induetry. Vine-growing is also carried on with far morn success in many dintricts; tons of fruit grown under glase are sold in the Auckland markete annually. It is believed by thove who know, that the production of wine may soon be entered upon in various localities; raisin, of courne, will follow the
development. Auckland has extensive orchards of Apples-some of them halfacentury old, which prodace excellent frait-return going up to from \(£ 40\) to \(£ 50\) per acre in favourable seasons-that is, when pents are kept under. In Otago orchard-planting is progreaning rapidly, all fruit of the temperate zone finding a congenial noil there; railway would play an important part in this development. It may be of intereat to note that the manafactare of cider is anaming considerable dimentions; aluo the drying of frait, which latter is helped on by the Government in various way. Jsm is being looked after, and if-ah, that "if"!-capitsl were bat forthcoming, very mach might be done in frait-preserving for home consumption.
From the material placed at my diaposal by the Agent-General, very mach more of interent might be given, bat pace will not permit; enough, bowever, ha: been placed on record to how that much mas be expected in the not far-diatant futare from New Zealand fruit-growern. E.C.

\section*{The Week's Work.}

\section*{THM HARDY TRUIT GARDEN.}
by W. Pops, Gardener, Highclere Castle, Newbury.
FILBERTS AND COB NUT8.-Nuts form a profitable crop in many parte of the country and well merit attention being bestowed apon the bashes in the matter of praning, and dressing the land round about them with manure. They aucceed admirably when planted in row midway between the lines of pyramid Apple or other fruit in the orchard proper, but better atill, if a piece of land be given up to their cultivation. This ahould be sheltered from the prevailing strong windr, a the blossom readily anfer from the fronty wind which are experienced at the time when Nat-busbet are ascally in bloom. To secure fine crope of superior Nats, the bushes should be planted 10 feet apart each way, and trained in much the ame manner an a well-balanced Red Carrant bash. Supposing the start to be made with a atrong-rooted ancker, this should be cat down to about one foot of the ground, and the growth resalting redaced to three of the atrongest and best placed. These during the succeeding winter should be hortened to about 3 or 4 inches from the atem. From growths apringing from there cat-back ahoots a sufficient number of branches will push to afford a selection for the foundation of a bunb, and they should be tied to atakes tuck into the ooil in a circle, the centre of the buih being kept clear of shoots. These main branches ahould be cut back annually at the winter's pruning about 12 or 14 inches; a good ahoot being selected from each in the mammer and trained at leader, and the atrong lateral growth slightly shortened. When the devired height in attained, which may be in 6 to 8 feet, all cosres growthe should be stopped, and at the winter praning old bearing wood and atrong moots freely shortened, leaving the mall catkin-baaring prapa untouched. It is best to defer the winter-praning till the female blossoms become visible, thinning and shortening being then carried out with more certainty of securing a crop of nuts. Suckert ahould be constantly kept down, and a moderate dreasing of good manure applied every year, and lightly forked into the marface. Naturally-grown bushen are, of course, much more common than these trained and closelypruned bushes, and deserve better treatment than uaually falln to their lot. In their came a wlight thinning of the topr, and the clearing away of suckers, will be beneficial. Aliberaldressing of manare as far as the roots extend will certainly lead to further improvement in the ize and quality of the nuts. If catkin are ecarce when the tree are in blossom, as sometimes happens, a few boughs of common Hazel, on which they are generally abandant, hould be cut and placed about the branchen for the purpose of fertiliation.

WINTER DREBSING FOR FRUIT TREES.-NOW if the right time for dreasing fruit trees infented with inects. The old-fashioned remedy of hotتater in which a small lump of soft-soap has been dienolved and petrolenm added, in a imple and effective dresaing. A wine-glanful of petroleum to each gallon of water will be as atrong as it is affe to ute it, and the mixture when applied chould be at a temperature of \(120^{\circ}\). Use a ayringe in diatributing. Keep it thoroughly mixed whilst aning by retarning
every other syringefal forcibly into the can or pail. For American blight the ame mixture is very effectual if well rubbed into the infested parte with astiff brush.

\section*{PLANTB UNDMR GLASZ.}

By W. H. Sxite, Gardener, West Dean Park, Chichester.
LILIUM LONGIFLORUM VAR. HARRIBI,-These plants should be kept free from aphis, which are apt to infest them, by an occasional fumigation or duating of tobacco-powder or nuff, the former being the cleaner and better remedy. The pot being now. filled with roots, slightly more warmth may be affordeत, and weak manure-water freely applied. These Lilie should be kept pretty close to the root and not hard-forced, or the flower-bud will become "blind."

Lilium auratum and L. Lancifolium.-Tae bulb of these species hould be potted when received from the nursery, and the pot planged in coal-ashes or cocoa.nat fibre, and cold frames placed over them. They will not require any water before growth commence.

MARGUERITE8.-These plants, if they are now placed in a temperature of \(60^{\circ}\) by day to \(55^{\circ}\) by night, will soon afford flowers in quantity usefal for cutting. An early vinery would be a suitable place for them if they can be placed where they are not shaded by the Vines. Plants atruck in the autama hould be repotted into 48 and 32 - sized pots, and will make nice-sized plant for flowering in the apring.

BEGONIAB.-Seed of the tuberourrooted varieties may now be nown, using for the purpose well-drained ahallow-pans in preference to pots. Place these on a shelf in the stove, and when the seedlings appear above ground, use means to prevent their damping off.

FREESIA8.-If these bulbe have been forced hard, flowers will soon appear, and the plants ahould be gradually given a cooler temperature just previoas to the expansion of the first blooms, which will form the right sort of preparation for the removal of the pots to the cool conservatory. Application of weak manure-water should be afforded, which will help materially to increase the size of the bulbs and improve next year' blossoms. Another batch bould be brought into a warm house, choosing the most forward of those in frames. If aphis be present on them, fumigate forthwith with Richards' Compound.

MIGNONETTE.-Seed in quantity may now bs sown in \(48^{\prime}\) 's, using plenty of mortar-rabble finely broken in the loamy woil, and a handful of horse-droppings to cover the crocks, which should be fairly plentiful. Make the oil very firm, and place the pots when sown and watered in a slightly-warm pit close to the glase.

HINTS ON WORK IN GENERAL.-At this zeanon when the weather is mostly unfavourable for out-of-door operations, an opportunity should be found for preparing for the epring, when nearly every kind of plant requires some sort of apecial attention, and many repoting. Where safficient shedding exists, heap of loam should be got ander cover in readinest for potting Chryanthemums, Carnstionp, \&c. It where the heap: are prepared a label be placed in each, indicating the use it in intended for, it will asve mistakes being made, and facilitate the operation. Peaty compont may also be prepared for Ferns, stove and greenhouse plantr, \&cc., and all the variety of items required ahould be got in readineas for usp. Plauts of all kinds should be thoroughly cleaned in the Finter months ; and Bagonis tabern examined, removing from them the old roots and soi!, but not to akinning them in so doing. Place the tabers in cocos-nat fibre in boxes or pany, and store in a dry, frost-proof place. Examine also Achimenes, Caladiump, Gloxiniar, and Hippeastrume, to ascertain their condition, and ahould any of the early Gloxinias have began to grow, they ahould be brought into the light.

\section*{THE FLOWER GARDBN.} By Bathex Wadds. Gardenet, Birdsall Gardens, York.
berry-bearina plants.-When planting new shrubberies and borders, or re-arranging old ones, care should be taken to include a good namber of berry-bearing plants. They are intereating and bright daring the autumn, winter, and apring months, when not taken by the birds, as they often are during revere
weather. This, however, should not discourage an extensive ase of such trees. The parple berrien of Mahonia aquifolia are beartiful during the early winter, when they often resemble clusters of mall black Grapes. The plant is one of the most usefal for groaping in mases, and its bright golden flowers and reddikh-purple foliage are very effective during spring. Symphoricarpas racemosas (the Snowberry tree), with its pretty small pink flowers and large white berries, is useful for planting in the background and under the shade of other trees. It will grow in any soil, and shoald be well dag about, and the suckera removed, or it will quickly overrun it bounds. There are many beantiful varietien of
Hawthorn (Crategus), that are showy whon flowering during the early nammer, and they have pretty and various coloured berries in aatama. Standard treen of thene may ba auitably planted as aingle apecimens on lawns and in the back part of nhrabberies. Crat \({ }^{+}\)gas pyracantha var. crenulata, or evergreen Thorn, with its clastars of scarlet berries, is useful for planting againat pillare, arbours and rains, dwelling-bonsee, or in warm nitaations it will nucceed as a bush plant. Another berry-
bearing plant that might be more largely grown is the Sea Backthorn (Hippophae rhamnoides). It is a pretty deciduous shrab, with silvery foliage, and the female plants are uanally heavily laden through the winter with yellow berrien. The plant is easily propagated by offsets. Plant in the background, as it grows tall. Elders with their various coloured foliage, and scarlet, golden, or purple clasters of frait are very beautifal when grown in masses or as specimen bushes. S sveral varieties of Cutoneaster are also good, as C. microphylla, C. buxifolia, C. marginata, and C. thymifolis, with fine evergreen foliage and scarlet berrien. The Strawberry tree (Arbatus Uaedo), with its fine foliage and scarlet frait, grows best in andy loam and peat. Then there is Aucaba japonice, and several variaties of Pernettyas, also many beatiful varieties of Hollies, all worth planting. The Bilberry, Blueberry, Cranberry, and other varieties of Vaccinium, succeed well in peaty soils. The Misleto (Viscum album) is in great demand at this eason for decorative purpores. To propagate the plant, rab the seeds into cracks in the bark of Appletrees, Thorne, Limer, and Avk. Protect them by a piece of net antil the plants grow. Ia diatricts where the plant is abandant, the Misleto-thrush and other birds feed on the berries, and pass the seeds undigested on to the bark and betwesn the branches of treer.

\section*{THE ORCHID HOUSES.}

\section*{B \(\lrcorner\) W. H. WeITr, Orchid Grower, Burford, Dorking.}
anaracums, etc.-In the East Indian-house, Angrasum sesquipedale is fast pushing out its flowerapikes, and theme should be examined daily for a mall specien of yellow thrips which attacks it. Should only a few of these insects be found, it is nevertheless adriable to fumigate the plante at once, and thus to deatroy all those that are imperceptible to the naked eye; failing this, a whole year's inforescence may be disígured. The pretty Angrecum pertasum having flowered, hould no be given ashort reat, receiving no more water at the root than is anfficient to keep the surface sphagnum moist. Angrecam pellucidum is now prodacing ita flower-apikes, and as these have a tendency to punh themelves downward into the compost, they should be conatantly watched, and assisted over the surface, so as to fall loosely over the sides of the receptacle in which the plant is growing. Should the apiken descend into damp sphagnum-mose, most of them may be lost. This apecies requires to be kept conatantly moist at the root, nutil its pretty flowers commence to open. Two carious bat botanicallyinteresting Orchidm now flowering are Arachnanthe (Vanda) Clarkei and A. Cathcarti. Taey appenr to nucceed beat when trained on upright Teak rafts or cylindern. As both plante have a distinctly penduloas habit when a certain amonnt of growth is made, they should not be uniformly tied in an upright position, bat allowed to droop naturally. Ualike many other apecies of Vanda, the atem of these plants should not be cut down when they become deroid of their lowermost leaver, for if allowed tbeir natural atraggling habit of growth, the aucceasful flowering of both planta is aasured. At all neavons they require copious waterings from the ayringe. Anarecum Scottianum succeeds well nnder vimilar treatment. It should be fixed to a cylinder of Teakwood, and its thin steme tied firmly to the rode, so that the mull roots may have something subutantial to cling to, and when in active growth it in
very important to occationaliy examine the plant, carefully tying the scandent growthe in an upright
position. position.

BRA88AVOLA8.-B. grandillora and B. venosa being both in flower now, their deliciou perfume pervades the whole houre, enpecially at night and early morning. The pecie grow thoroughly well thespanded on Teak rafte, the plants being fixed to the wood with their terete leave in a pendent porition.

CATTLEYA-HOUsE.-Plants of Catcleya Parcivalliana are now throwing their flower-apiker, and need a little extra, water at the root. Should mild weather continue, thin house will well nuit their requirements, but in the event of aevere frost a few degrees more warmth will be necesary. Plants of Periteria elata whose preado-bulbs are fully made up, should be placed in a light position in this house, and ba given sufficient water at the root to prevent shrivelling. Other apecies now at rest, and whicy require nimilar treatment at this season, are Chyis Chelsoni, C. bracteacens, C. Sedeni, and C. arrea, alao such Orchida as Luddemannias, Acinetas, Gongoras, Stanhopeas, \&c.

\section*{THE KITCEAN GARDEN}
by Jonim Lambert, Gardener, Powil Cantle, Wolahpool.
GENERAL WORK. - The weather being too wet to work on the ground without doing harm, sundry other jobs may be attended to. Pea-stakes and Bean-rode may be cat before the sap risef, and they may be trimmed and put in nizes ready for une. Look over those saved from last season, and pict out the best to be fresh pointed. Boxes will need attention, and a regalar stock of new one ahould be made each year, benider repairing the old oner. Wash all pota, and pat them away in a dry whed ready for une, keeping each wize in its proper place. Ths ceed-room may be overhanled, throwing away all uselens seeds. New homs-raved need may be put away in thair respective drawers, which should be plainly labelled, so that they may be readily found in a busy tims. Look up notes raspecting crops and seeds, and put them in order, for the new seed listy are now nrriving. Icehousen, if emptr, should be thoroaghly cleaned oat and whitewashed, and left open to aweeten. Tools that were not put in order after the work last winter, should be sharpened and mended, if necessary. Bracken or other maserial should be cut and put in readiness for the atacks of ice made in the open. We are still using from the outside stack, and the ice-house is not yet opened. Box-edgings that have become old and leggy should be relaid, as nothing gives a garden a more antidy or neglected appearance than badly-kept edgiugs to walke. If appavel can be obtained on the estate, a stock should be zereened now and pat ready for fatare use. The walky may be tarned over where the practice is adopted, and if they are fresh gravelled now, a light coat later on in the apring will make all cidy. If tile, stone, or brick edgings are used, they thould bs atraightened and monded where necertary.
root houses shoald be given close attention. Potatos are, perhaps, the most important of these. Look over the tabers carefully, and remore any suapicious ones an well as as thone which are decayed. Room will now be found to spread them out thinly. Oaions shoald be forted, and any which seem inclined to grow welected for present use. Give plenty of room to all the amaller onen of James' Keeping and other goodkeeping varieties. If not yet done, tie up in bander, or trans if plenty of time on hand, any that may have atalks enough attached. In this shape they can often be accommodated in places better adapted for keeping them. Shallote and Garlic should be cleaned and put safe from frost, ready for apring planting. Carrote, Tarnips, and other roots may receive similar attention. Take off all growtha, as if these are let grow, the roota are not of good flavour.

FRUITB UNDER GLABE. By Riochan Pakesk, Gardener, Goodwood, Chichester. MELONB. - In order to cat ripe fruite in April, seed should be nown in the firat week in the new year, or alightly earlier. For yearn patt it has been year, or sitighty earlier. Boxing day, and I have seldom failed to cut a ripe frait in the first week in April. Two seeds should be placed in 3 -inch pota at a diotance from the edge of the pots at about half an inch, and half an inch
deep, the woil being sifted loam and leaf-mould, the noil being made moderately firm below the seed, and leas no above them. SJwn in this manner, the plant can be repotted or tarned out without root-diatarbance. It is an advantage to grow the earlieat Melon-plants in pairn till they reach 1 foot in height, owing to nuavoidable losses by damping, insects, \&cc. The pots thoald be clean, dry when used, and well drained. The pota con!aining the seed, should be planged in a hotbed having a bottom-heat of \(80^{\circ}\), and top-heat of \(70^{\circ}\); germination will then take place in few daye, and if the soil be fairlp moiat, no water will be required till the planta appear, and may not then be required. Tepid water hoonid be ased when water becomes needed, and it mast be carefally aff srded through the pout of amall water-can, not wetting the learea or stem. The plante abould not atay many day in the frame, or they will become drawn and weak; bat they mast be gradually accuatomed by affurding air to the frame, to a warmth of a pit or house of about \(68^{\circ}\) or \(70^{\circ}\) by day, and not lean than \(60^{\circ}\) at night. Stand them on a shelf near the plas. For early work, the planter may bs fraited in 10 iach pots, or two plante may be grown in a 12 inch one, but I prefer planting them out on billocke of tarf on a hot bed. In the meantime these hot-bede should be made up in the house or pit in which the plants will be grown, using atable litter and leares in this proportion, the firat may be one-third and the latter two-tbirds, which I have recommended to have in readiness. These should have been tarned over and well mixed together two or three times, and then left to ferment for a few days before making the bed. This may be from 3 to 4 feet ia width, and bailt up pretty close to the trellis, so that the plants may be near the roof glass. If the young plants occupy the houre whilat the hotbod is being made, mesns must be taken to let out the ammonia ariaing from fermentation, or they may get killed by it; indeed, it is better to have the plante meanwhile in a plant atove or Pine-pit. When forming the hillocke of soil, aslate or two hoald be placed under each, no as not to let the roots get into the hot-bed materials, as this would result in very rank growth. Seed may soon be woxn for accession, the treatment of the seed and plante being similar to that given. Thers mant bs caution used in the matter o? firehest to young Melon-plante, or red-epider will soon infest the foliage, causing grent injary to the plant.
cucumbers. - Plants which map be in fruit will receive every encouragement to keep them in health, and remembering that much moiture at the rooto is almost as injarions to the plants at this seaton as dryass. The soil should be lept fairly moist, and nothing more. A small quantity of Clas's Fertiliser, or bone-meal, afforded once a week as a earfacedressing, will keep the plata in a better condition than farmyard manure-water. Be careful in regalarly removing pent foliage, male blooms, and deformed fruits, and do not allow the p'ante to carry any more fruit than are really required, and there should be cut before they are fally grown.

TOMATOE. - Young planta in amall pote mast be kepts growing near the glass in a fairly warm houre, ventilation being given during mild weather. Tae plants should not ba allowed to becoms pot-bound, nor be over-potted. Weak liquid-manare may be afforded once or twice a week to bearing plantr, and the items tied to stakes as required. Keep the growth stardy daring dall dayp, as planta rendered weak in any way aeldom give good crope later on. Seed of an early-fraiting variety may bo nown thinly in pans, and placed on a shelf in a warm-hoase, pricking off the weedlinge when large enough to havde at 2 inches apart, and keeping them close to the glan. It is from thic sowing that fruit may bo gathered in April. Pianta in beariag may be cop-dreased with fresh loam and well-decayed manure as the roote extend. Weak manure-water made from sheep' dropping, is also beneficial in suiating the fruit to -well. Continue to ventilate the hoane during mild weather, affording artificial heat all the mame.

Sand-hill Planting.-Mr. Rydbega (Contri). U. S. National Herbarium, iii, 3, Seps. 14. 1895), hav an interestiag pap3r on the nad-hille of Nebraska. The characteristic graves which biod the eand together are Calamovilia loagifolia, Eragrostin tonnis, Redfeldia flexuora, and Miblenbeckia paagens. Mr. Rydbera recommend the planting in snitabla situations of Pinus Bunktiana and \(P\). ponderora var. acopaloram.

\section*{EDITORIAL NOTICES.}

JORRECTED AVERAGE TEMPERATURE FOR THE ENSU. ING WEEK, DEDUCED FROM THE OBSERVATIONS OF FORTY-THREE YEARS, AT CHISWICK.-36.7 \({ }^{\circ}\)

A metrospect of the progress of
1805. hortioulture for the year now at its close is, as usual -
"Of a mingled yarn, good and ill together."
We hope we shall not be thought too optimistic if we say, that putting aside matters of secondary importance, the good has predominated, and hortioulture has progressed. It is likely enough that anyone seeing only the routine exhibitions, for instance the endless Chrysanthemum shows, presenting little or no difference one from the other, except in extent, would say that the wheel turned round bat did not advance. It is not, indeed, in this direotion that experience has taught in to look for progress. The most encouraging signs we see for the advance of horticulture in general, are the steps being taken in our raral districts for the promotion of technical education. We are still a quarter, if not half a century behind other nations in this particular; but, at last, we are moving, and when we do move, we are apt to do ao pretty thoroughly. Technical education is understood in various ways in the different connties. In some, it means perfected routine; in others, it means inatruction in general prineiples; whilat in a third category, it implies not only inoressed skill, bat skill directed by judgment begot of knowledge, whioh should be the highest aim of practical cultivators. Each distriot has its own requirements, and is influenced by ita own local oonditions, so that there is no neoewity to uphold the one at the expense of the other; suffioe it to note, with satisfaction, that in one way or in another, progress is being made, and progreas of a kind that is likely to increase in volume rather than otherwise. The large extension of fruit-growing and of marketgardening is also a matter for congratulation in the present depressed state of agriculture.

The garden crops generally have been good this year, theextraordinary oold of February coming too carly to infliot much damage; whilat the hot, dry antumn, if there be any thing in well "ripened wood" an offering a forecast for the future, should favour our fruit orops for the following season.
Exhibitions in Losdon and the provinces have been more numerous than ever, but none has presented any novelty or any speoial features worthy of comment in a brief retrospect like this. Of literatare pertaining more or leas to hortioulture, the year has been prolific, It will be afficient to mention the oompletion of the

Inilex Kewensis, the compilation of which is indeed a boon, the appreciation of which will constantly increase as time goes on. Krbner \& Oliver's Natural Mistory of Piants is another book that will be of the utmost value to thoughtfal hortioultarists. Dr. Weiss, too, has rendered good servioe by pablishing a translation of Dr. Soraurr's popalar Treatise on the Physiology of Plants for the Use of Gardeners. This is the nearest approach that has yet been made to Lindley's Theory and Practice of Horticulcure, the theoretical portion of which latter volume, of course, is long out of date. Professor SAhGent's monumental work on the Trees of North America progresses steadily, and will be of the atmost servioe to arboricaltarists. The numerous hand-lists and other publications issued from Kew are within the means of any ordinary gardener, and should find a place in every garden-library. Of the new edition of Paxton's Calendar, prepared by the members of the staff of this journal, it does not become us to speak further than to say that it is intended for cottagers, allotment-holders, and ocoupants of small gardens generally, and has found mu h favour with the public. The aseful monograph of Masdevallia issued under the auspices of the Marquis of Lothian by Miss Woolward is approaching completion. Another work whioh will take its place as a classic is Miss Amherst's History of Gardening, lately reviewed in our oolumns.

Forestry has at length been enriched by a scientific treatise of the first order of merit, pablished by Dr. SCHLICH, with the assistance of some of his colleagues at the Cooper's Hill College. A new and revised edition of our old friend Brows's Forester has also been published.

The reports of the Epping Forest Commission express in the main the views and feelings of those who have any knowledge of woodland management, and an intelligent love of natural history. They will, we hope, for a time at least, silence the olamour of well-intentioned but illinformed enthusiasts.

The obituary record is unfortunately long, and inoludes the names of some of our beat-known gardeners, such as Wilhiam Thomson, Thomas Bainrs, John Wille, Riceard Gilbret, T. H. Rabone, Petre Gitevr, C.F.Bausk, and others. Among men of soience more or less directly conneoted with horticulture who have been taken from us, mention may be made of Pasteur, Huxley, Babington, Baillon, Bommer, Bernardin, Hellriggel, Rilfy, Truffaut, Vrsque, Profermor Lawson, Cleghorn, and others.

The discovery by Lord Rayleriah and Professor Ramsay of a new element in the shape of argon does not seem at present to have muoh oonneotion with practioal gardening, but one featare of these epooh-making discoveries is, that the most unexpected results acorue from them; and we may not unreasonably look to future researches into the nature and action of this gas to aupply fuller information than we have, at present, on the nutrition of plants, and the part that nitrogen plays in the vegetable kingdom.

As the discovery of argon oansed a flutter of exoitement among scientifio men, so amongst the gardening fraternity consternation was felt at the oircumstances sttendant on the retirement of Mr. Barron from Chiswicls. Whatever object the Connoil of the Royal Hortioultural Sooiety may have had, they succeeded in wounding the sasceptibilities of the gardeners and of their own committee by the ill-advised manner in whioh, no doubt unwittingly, they carried out their object. The Sooiety has ated handsomely to their late Superintendent, so
that it seems olear that no personal slight was really intended to him. As Mr. Barron retires with a substantial pension, and has been made a Life-Fellow, there is no necessity to dwell on the personal side of the question. But wholly apart from these personal considerations, there are prinoiples involved in the unfortanate mode of action adopted by the Council which cannot be thrust aside by the somewhat lame apology that has been published on their behalf, principles which involve the honour of the several committees. These several committees have been, as usual, busily engaged during the season, and it behoves them to be more than ever stringent in their awards. Wherever ciroumstances permit, no definite award should be given till the exbibit has been watched daring growth at Chiswiok. A remark of Mr. Shea's in the pages of our energetio contemporary, the Gardeners' Magazine, illustrates the desirability of insisting, wherever it is possible, upon some more thorough test than is possible by the mere comparative inspection of flowers on a board. Mr. SHeA's statistios show that the great majority of oertifioated Chrysanthemums never afterwards make their appearance on the exhibition tables; or if they do, that they speedily fail to retain the favour of the growers.

Oar exhibitions may be attractive to the public and very seductive to prize-seeking exbibitors, bat their main object should be the advance of hortioultare-a point not safficiently considered by the Royal Hortioultural Society, and almost ignored by the provincial societies.

Of the future we need not spealk now, but it is impossible not to look forward with eager expectancy to the futare development of Chiswick as a trial garden and experimental station. At Chiswick we look for processes, at the exhibition table for results. The results may be the more stimulating, but the processes are the more instructive to the gardener.

Cooper'a Black and liros Maroe

The Journal of Horticulture for December 5 has an excerlent and interesting artiole on this subject, which shown, among other things, the need of maintaining at Chiswick a "type colleotion," not only of Grapes, but of fruits and vegetables, which could be referred to in case of dispute or uncertainty. At the same time, a collection of photographs and coloured drawings should find place in the Lindley Library, so that we might have, as botanists have in their herbarias and libraries, some authentic standard of reference. Of course, allowance must always be made for natural variation, as well as for that whioh is obviously the result of a ohange in the nutrition of the plant or other conditions. The necessity for this is well exemplified in the following extract from our contemporary :-
"We only attach mall, if any, importance to alight variatione in shape of berry as a factor in diftinctnem of variety. A few yeara ago we called on a large grower of Muncat Grapes for market. He was busy at the moment auperintending the forking into half the length of the inside border the heavieat dreasing of nitrate of coda we have ever eeen or heard of being used. "Jutt an experiment," he remarked. When the Grapes were nearly ripe we were ahown the reaults. The berries were half as large again at thowe hanging from the other half of the roof, and the oval ahape had practically vanished. To use the expreasive phrase of the owner, the nitrate of soda had "blown them out;" those on the other half of the roof (border undressed) were much amaller, and quite oval. This is mentioned as a atriking example of variation in which the direct canae was known. We do not advise private gardenery to follow the example mentioned, or they
might "wear out" their Vinen too woon. This market grower is always working on the express syatem - clearing ont nome housen and planting othere every year; but thie cannot be done in private garden..

The general conclusion at whioh our contemporary arrives is atated in the following terms:-
"We are decidedly of opinion that the Grapes grown an 'Gros Maroc ' and 'Cooper's Black' muck too closely reatmble each other to be uhown an diatinct varieties, and consequently an exhbit containing them mast be liable to disqualification."

F Synandrobpadix vermitoxicub, Engler.: This on namental and very distinct Aroid flowered recently in the Royal Gardear, Kew, and from it our illatration (fig. 131) wat made. It is a native of Tucumar, one of the Argentine provinces, and on the firat occanion of its flowering in this country, was figured in the Botanical Magazine at t. 7242 , from a plant caltivated at Kew. In habitand foliage it beara some resemblance to a Richardie, bat the inflorencence is more like that of Taccarum Warmingianum than of any other Aroid known to me. Like the reat of the group to which it belongs, ite root-atock is a tuber, which is asid to attain a weight of 3 to 4 lb . The leaves are three to four in number, with petioles \(1 \frac{1}{2}\) to 2 feet long, of a light green, marked with darker green lines, and the blade in brighs green, 13 to 14 inche long, by 8 to 11 inches in breadth, cordate-ovatp, ncats, with wavy margins. The inflorescence is produced with the leaver, on a pedancle 6 to 8 inches long, which is of a light greed, with darker green lines; the apathe is about 7 inche long, and 3 to 3 inches broad, erect, elliptic-oblong, cuncav', convulute at the apex into a sabalate tail-like point; the outside is green, and the inside dall purple-madder, both aides betng ornamented with shurt darker atreake. The lower part of the padix which bears the fimale Howers is adaate to the apathe, the reat beiog free, and covered aft round with male flowern ; there is no perisnth to the fluwer, but the green uvaries are sorrounded by fuur ovate, obtanf, dall purplish staminodes the mamens of the mate flower are anited into a atout, - Nullen, josj-parple colamn, armounted by amali head of blackinh-purple anthera. There are aeveral other Aroids in the Argentine Provinces and South Hraz ', that are more or less allied to this plan', belooging to the genera Taccarum and Asteronigme, which are ornamental in cbaracter, and well worth the troable of iatrodacing. \(\mathbf{A}\) few of them have been under cultivatior, but only in a very limited quantity, I beliefe, and they appear to have soon died out. There ought to be very little difficulty in \(r\) aiaing them from seed, but I believe that they require to be cron-fertilised, af, in the few casee known to mp, where Aroid with an infloreacence of this character have been aelf-fertilised, the renuit has alway been a failare. N. E. Brown.

Our Almanack.-Secretaries of Horticultaral Societien and others, are earnestly requented to forward immediately, the dates of Show Fixturee and of Meetinge of Botanical and Horticultaral Societiea of any kind for 1896, for ineertion in the Almanack, to be pablished in our inaue for January 4.

City of London Colieae, White Street, Moorfielob.-Profemor Boularr, F.Lis., F.G.S., A.S.I., will deliver an introductory course of twelve lecturen on "Commercial Botany," on Thuraday*, 8 to 9 PM , commeacing Thuraday, January 9, 1896, The following subject will be treated of : The Hintory of our Trade in Vegetable Producte-Food Sabatances - Drugs - Oils and Oil-weeds-Gams, Resins, and Rubbert-Dyes and Tanning Materiale - Fibreil and Papar Materials-Timber and other Wood-Agricultural Plants-Miscellaneoua Vegetable Products.
- Daring Lent Ters, 1896, Profemor Bovecnir, F.L.S, F.G.S., A.S.I, will also deliver a course of ten lecturen on "Forestry" on Thuraday evenings, com-
*Synandrospadix vemmitoxicus, Engler, Bot. Jehrb., 1883, val. 4, p. 62.
mencing January 16 , at 9 p. w. with apecial reference to the examinations of the Sarveyors' Institation. Practical demonetrations in the country will be given during the apring. Syllabus: Climate and TreesLand witable for Arboricultare-The Draining and other preparation of the Land-Narseries and thair Management-Plantiag Operationa-Thinning and Maintena ice - Felling and Barking - Timber Measurement - Exploitation and Management of Coppice-The dietinctive charactert of the variou* British Timber Trees.

Kew Seed List.-In the form of an appendix to the Bulletin for 1896, has been published a list of meeds of hardy herbaceous plant\%, trees and shrubs, available for exchange with other gardens and with regular corrempondente. These seede cannot be bed by purchase. The list occupies no fewer than thirtyfive 8vo pagen of double column.

Rare Books and their Prices, with chapters on Pictures, Pottery, Porcelain, and Postage Stamps, by W. Roberts. (London: George Redway) Mr. Roberts hae here enlarged upon and repablimbed in book-form certain of his articles which first appeared in the Nineteenth Century and the Fortnightly Review. He treat of the present-day mania for collecting, and of the large amounte of money which those able to do to will spend on their favourite hobby. Collecting has its good and its bad aider, and both are here touched on, but the book is chiefly occupied with mention of rare booke, articles of porcelain and pottery, and with quaint and true tales of the prices which some of these have fetched at different atages of their career. It is an interesting volume, both to those who find their happiness in parsaing the collecting mania and to othera who prefer to watch such enthasiasts with amusement and without joining them in their pursuits.

Berlin Industrial Exhibition, 1896.-Oae of the apecial feature of this exhibition is to be an intereating and inatractive department of horticalture. Oa one of the best-nituated positions, near the main bailding, and between the recreationground and the Marine Panorama, will be opened five hectere for the sole purpose of the horticultural nection. This portion of the exhibition, which is already partly completed, is being carried out under the direction of the Economy Councillor, Herr L. Spätr, an acknowledged authority on horticulture. Someeighty firms in Berlin and environsare here represented in a more or leas prominent manner. About half of the ground allotted to this group in claimed by the tree plantation exhibitorr, and by the landcape gardenera. A plendid park of 1900 mère: quare has also been kilfally arranged on wellchoen groun', and several promicent gardeners have secared a large and desirable position to utilize for origioal landacape gardens. A lawntennis ground in trae Eaglish atgle is also contemplated. Fruit culture of every species will also play an important part in the Barlin gardening induatry.

Cottage Gardenina."-Vol. vi. of Cottage Gardening, edited by Mr. W. Rominion, is now ready. (Publinhern, Mesurt. Cassell \& Co) It treate of the uaval abbjects-poultry, window and town gardens, allotmentr, beer, simple cookery, and honeekeeping; and is quite equal to the previous volumes in value and intereat.

Cut Flowers: Ofchids.-M. Luciek Lindras's energy is remarkable. Not content with the direction of the Horticulture Internationale, and the publicatione connected therewith, he has eatablished at Moortebeke, near Bruuele, un vaste etabliseement for the ale of cut flowers of Orchidr. The name enterprising man of butines har, in conjanction with M August Dallemagne, founded at Rambouillat, France, a apecial eatablishment for the growth of Orchide.

Ancient Society of York Floniats.-The annual dinner was held under auspiciou circumntances on the 18 th innt, there being about nixty members prenent. Mr. Alderman McKay prenided, asd incidental to the observance of a long tomat lint,
it war atated that the Society intended to hold an exhibition in York during next year, contemporaneously with the show by the Yorkshire Agricultaral S ciety. Oit this occasion the National Carnation and Picotee Society will also be represented. The finances of the Society are satiafactory, notwithstanding that unfortunate weather attended the recent exhibition of Chrysanthemama, there being a revarva of \(\mathfrak{£} 210\).
the royal horticultural society.-The meetinge for 1896 have been arranged to take plac 3 as follows:-As the Drill Hill, Weatminater, on January 14, February 11, March 10 and 24, April 7 and 21. May 5. Jane 9 and 23. Jaly 14 and 28 , Augast 11 and 25, Siptember 8, 0 stober 13 and 27, November 10 and 2t, and Dscember 15. The annual general meeting will be held at the Sjciaty's officer, 117, Victoria Sireet, S.W., in the afternoon of Febraary 11. Tha Temple Show will take place on May 19. 20, and 21. A great exhibition of B itithgrown fruit will be held at the Cryatal Palace on October 1, 2, and 3 .

Veitch Memorial Medals and Prizes At a meeting of the Trustees held on the 20 th inst., Dr. Hoga in the chair, it was resolved to present a Veitch Medal to the following gentlemen, in recognition of their services to scientific horticultare, forestry, and arboricultare - viz, M. Henri L. de Vilmorin, of Parie; Professor Sargent, Director of the Arnold Arboretan, B itson, U.S.A. Mr. F. W. Barbidge, M A., Carator of Trinity College Botanic Gardens, Dablin; and Mr. Malcolm Dann, of the Palace Gardenv, Dalkeith. Is wal also resolved to place at the dispozal of the National Rose Society two medals and two prizes of £5 eacb, one to be competed for at the metropolitan ahow held at the Crystal Palace, and the other at the northern ahow to be held at Ulverston; two medals and two prizer of 55 each at the dispoasl of the National Chrysanthemum Society, to be competed for at the Jabiles exhibition of the Suciety; and one medal and one prizs of \(£ 5\) to each of the following provincial horticultural societies, Ulater, Dindee, and Derbyahire.

Quantity of Worked Trees in an American Nussery, etc.-As in many other commercial line the anount of trade done in ame of the Uaited States' nurseries in prodigious, greatly excseding anything that we can how on this side of the Atlantic, and as illustrating this fact, we take the following remarks from the National Nurseryman, a journal circulating amongat growers and dealers, and published at Ruchenter, N.Y. "The Franklin Davis Naraery Co. We have just atarted into what promises to by a eatisfactory fall aeason. Our ales, both wholesale and retail, are about the same as those of \(18 \%\), the mane quantity of atock being nold, but at lower prices. We nee no difference, however, in cost of production. There seems to be a atrong demand for Peach trees and Japan Plana. Prices appear to bs lower on evergthing but Peach; gredea under 3 inch in Applea and Para are exceedingly low, and there is no chance whatever for profit at such figures. We have made pretty heavy plantings in the spring of 1895, truating that there will be an improvement in the buines by the time the atock is marketable. We budded 650,000 Peaches thin seavon, and would have doubled it, bat ran short of seed. In 1894 we badded 1150,000. We planted 500,000 graft in the spring of 1895 , which have done well; and budded 50,000 Pear and 200,000 Apple atock. From the general outlook, we are fearful that we have planted too mach, and we are almont confident that nearly all the growers have done the name thing. There is certainly an over-production, and we do not believe that the 'hard times' are altogether accountable for the low prices. The only man who is making money now is the dealer: he buyn at lens than cost of production, and is able to get a fair price at retail. We have had a good growing veamon here, and ntock never looked better. We are digging 25,000 to 35,000 trees per day without our tree-plough. It is a little too dry to run it antinfactorily." Oar readern
will naturally wonder what a tree'd roots look like after being ploughed out of the land. Other report. in the ame journal show that the demand for Apples will run the stocks of saleable trees very low by the arrival of spring. From Topeka we learn that the autumn trade is good; a little above the average in volume. Northern and western planter are heavy buyers of Apple trees. Colorado trade gaining heavily on Ben Davis, Gano, Paragon, Arkansas Black or Jonathan. Northern trade atill inaists on Ducheay, Wealthy, Yellow Transparent, Wolf River, \&c. Cherry gives slow sale, price lower." Apparently the demand for Apples in a heary one in the temperate region thronghout the U.S.A. Those growers in Great Britain who have suitable varieties might participate in the trade in Apples, Plums, and Cherries.

A Curious Cabe of Natural GraftinaMr. Joun Cherse, of Amersham, furnished lately to the Royal Horticaltural Society a photograph and description of a case in which, io pite of the severance of a branch from the main trank of a Pear, the evered branch produce fruit year after year, commanication with the leave and trank baing carried on by means of a slender twig, which connect the severed portion with the main stem. Mr. Cheese's account is as follow: - "In 1889, an arm of a Pear tree (Vicar of Winkfield) which did not bear, wa: severed for grafting. By accident, the old arm wa: not taken away. Next year as it blnzsomed, I left it to what its vitality would come to. It produced and ripened two Pdars. As it seemed vigoroas, I said 'leave it another year.' It produced ten fruits. I then made a careful examination, and foond that a amall twig about the nize of my little finger had joined itself to the old branch on the top of the wall by friction of wind. It kept on bearing. Last year [it bore] fortp-two, this jear just uader thirty-fed ontirely by the twig now almost, or quite, an inch in diameter. The branch has been in perfect vigour ; and by the pencil sketch, you will ses what the feeder has done. Tha tres baing planted in an orchard, and turned over the wall (one branch) and trained down the other side (garden), makee it rather difficult to give a real idea of it

From the sketch and photograph, it appaar that the only direct communication with the roote or with the old atem, is by means of the inosculating branch. No doubt, as Mr. Cherses ays in another letter, the union wat effected prior to the everance of the branch. Ia any case, oo far as the fruiting branch in concerned, the entire anply of water must pase from the root upwarde, till it reaches the slender connecting twig, then downward to reach the fruitbearing branch, and then more or less horizontally. Tue quantity of water thus supplied is afficient to permit of the exparion of leaves, and these in due course manafacture, with the aid of the an-light, the sugar, starch, and other products required for the maintenance of the branch, and of the frnit, produced from it. Sach cases are more easy of comprehension, now that we have, to some extent, got rid of the "valgar errore" connected with the "atcent and deacent" called, of the sap.

SOUTH Africa.-A supplement received with an isnue of the Wynberg Times for November 30 last given a detailed liet of the clases arranged in connection with an exhibition to be held by the Port Elizabeth Agricultural Society in April next. That there in conaiderable energy at thin port in matter agricultural is clear from the fact that the uchedule include as many as 408 classes. Every kind of farm atock, including poultry and pigeon, will be rerrenented, and the same may be said of farm prodace, agricaltaral implemente, and Sonth African manufactaree.

The Cape Herbarium ie now ander the charge of our valued correspondent, Prof. MacOwan, the colonial botanist. The nucleus of the collection was the herbarium of ZRYFER , or what remained of it at the Cape, for a large proportion was deatroyed by fire at Hamburgh. The remainder of Zryerbes plante came into the pomemion of \(\mathrm{Dr}_{\mathrm{r}} \mathrm{PAPPI}\), and at
his death they were bought by the Government for £400-a num very far below their value. Dr Harvey made ute of the collection for his flord Capensis. After this it was much neglected, till Sir Henry Babrey paid a surprise vieit, and at his instigation atep were taken to preserve the plant in a proper manner. Prof. MacO wan's own collections numbering some 5000 pecimens, were added in 1881 and the collection is fairly well housed, except for the rink of tire, which is atill great. The value of a herbarium and library to the colonial botaniat, and those who apply to him for information on all worts of topics, in incalculable
"The Central African Planter."-Among the many encouraging aigne of progrent, we may note the publication, at Songani, Zomba, of the firnt number of this journal, which bear out the old adage that there is alway momething new from Africa. The pa blication will take for ite model the Ceylon Tropical Agriculturist. Oar fatbers, not to mention previous generation, would have been astonished to see such sign of development in a part of Central Africa not known before the time of Livingstone in 1855. Lens than twenty-five yeara afterward Coffee planting began, and in 1891 a million Coffee plante were in cultivation. Coffee, indeed, is the principal aubject treated of in this journal. Telegraphic comm unication with Great Britain via Cape Town was establinhed at the time the journal went to preas. May it be a good omen, and may our energetic plan ters not forget to occupy mome part of their time in mahing known the resources of the country, and in sending home apecimens of it flora and fana. Who can tell that some now-unheeded plant may ncteventually be more commercially valuable than Coffee. The editor is Mr. R. D. Hyndr, F.R.G.S.

The Surveyors' Inatitution.-At the ordinary general meeting, beld on Monday, December ?, 1895, the Preaident (Mr. Daviur. Watriny) in the chair, a paper was read by Mr. F. Puxcmamd (Fellow), entitled, "The Working of the Agricultural Holding: Act, 1883." A discustion followed, and was arjourned to the next meeting, and a vote of thanks was unanimously passed to Mr. Punchard for his paper.-The next ordinary geveral meeting will be held on Monday, Janaary 6, 1896, when the adjourned diacuaion on the paper read at the lant meeting by Mr. F. Punceard (Fellow), entitled, "The Working of the Agricultural Holdinge Act, 1883," will be reaumed. The chair to be taken at 8 o'clock. Notice if given that the Inatitution will be clowed from Tuenday, 2 th h inst., to Monday the 30 th inst.

The Royal Gardenera' Orphan Fund.The aual monthly meeting of the committee took place at the Horticultural Clab. Hotel Windsor, on the 20th inat., Mr. W. Marshall, presiding, there being a large attendance of membert. The Secretary, Mr. A. F. Barron, reported that he had received the sum of \(£ 105 \mathrm{l} 5 \mathrm{~s} .10 \mathrm{~d}\). from the trustees of the William Thomson Memorial Fund, the powert as to roting at elections in repect there of being accepted by them. It was resolved that the sum of \(£ 500\) ahould be invested in Canadian \(3 \frac{1}{3}\) per cent. atock. The following opecial receipts were announced:Mr. H. J. Jones, Ryecroft Nursery. Lewishaw, Viatorn to Chryanthemum-house, \(£ 10\) 12s. \(7 d_{0}\); Scottish Horticultaral Asociation, per Mr. R. W. E. Marray, Edinbargh, £5; Mr. H. Herbat, Stanmore, Kew, £2 11s. 6d; Mr. G. W. Camminn, The Grange Gardens, Carahaton, £2 10s.; Mr. W. R. Bloxham, Chesterfield, \(£ 2\) 2s.; The Market Harboro' Horticultaral Society, wale of flower at Chryanthemum how, per Mr. G. Green, ecretary, £1 15s.; Mr. R. Ingleby, Chesterfield, \(£ 1\) 78. 6d.; Mr. C. Gibeon, Morden Park Gardent, £1 1s. Td.; Mr. J. McKechne, Holloway, £1 1s。; Mesura, R. W. Proctor \& Son, murnerymen, Cbesterfield, sale of flowers, \&1 1s.; The Croydon Chrysanthemum Society, ale of Clowere, per Mr. W. B. Beckett, £1 1s, ; Kinguton Gardeners' Association, per Mr. A. Dean, £1; Mr. W. Bates, Twickenham, 18s. 6d.; Mr. F. Miller, Northdown, Margate,
188. 2d ; Mr. T. Newbould, Cragg Royal, Leeds, 178. 6d.; Mr. A. J. Brown, Chertey, 15s.6d.; Mine Enoily Roger, Farnborough, 13s.; Mr. W. H. Diverp, The Gardens, Belvoir Castle, 13s. \(7 d\).; Mr. John Day, Galloway, Garlieston, \(12 \varepsilon\), and Meantr. H. Cannell \& Son, Swanley, 10s. It having been announced that at various times daring 1896, nine children would cease to be chargeable to the fund, having reached the age of fourteen yeare, it was resolved that ten children hould be elected at the annual general meeting to take place at Anderton's Hotel on Febraary 20 next. The credentials of a number of children were examined and panaed. A cheque was ordered to be dravin for the children's allowances for the first quarter of the coming year, amounting to £195, there being sisty children entitled to the benefit of the fund. A hearty vote of thanke was passed to the chairman for his services in that capacity during the year; and Mr. Marshall, in acknowledging the vote, thanked the committee for their support and attendances during the year.

The National Amateur Gardeners' AssoCIATION. - The annual dinner took place at the Gaildball Tavern on the 18 sh inat., Mr. T. W. Sanders, the Preaident, in the chair, about eighty person: boing present, including everal ladies. In proposing anccess to the association, the chairman said that this was the filth year of its existence, that he had been ansociated with it from the first, and was well acquainted with its advantages. It was able to show that it had done good work, and therefore juatified ita formation. There is an increase in the number of ite country members and affiliated societies; both together there are probably from 2000 to 3000 persons connected with the anociation. The association afforded opportanities for those amateurs interented in gardening to meet together and exhibit their skill an cultivators ; and in this way they were inatramental in intereating others. Nothing in the way of an amociation worked on buniness principles can be perfect, and there were imperfections in their procedure, but the conductorn were alway anxious to receive angentions for perfecting their organisation. One atisfactory feature at their monthly meetings in the collections of flowerp, plants, fruitr, and vegetables brought to them, and which are closely inspected by the members. Points were awarded to meritorious exhibita, which carried with it a Certificate of Merit; and when a sufficient aggregate of point wat reached, a Silver Medal wan awarded. Another feature wat their conversazione, which proved so antisfactory that it will be continued on a larger acale. The President paid a tribate of acknowledgment to his brother-officere and committee, as it was mainly through their exertions they had scored so satisfactory a succes. The distribution of moneyprizes, medals, and certificater then took place, and a accession of speches, interapersed with music, brought an enjoyable evening to a close. It was annonnced that the next monthly meeting on Jan. 7, Mr. R. Deas will give a lecture on "Hardy Border Primrones."

Gardenera' Royal Benevolent institu. TION, ETC.-At the meeting of the Committee of the Wolverhampton Auxiliary of the Gardouera' Royal Benevolent Institution, Mr. G. A. Bismof, the chairman, handed in his list of aubucriptions which he had himself collected in the course of a few weeks, amounting to the handsome aum of \(£ 70\), including twenty-six annual ubacribers of one guinea each. It may be mentioned that benides, Mr. Bishop, in conjanction with Mr. G. Bradeer, Werga Hall Gardene, collected within twelve monthe, £146 for the Wolverhampton Chryanthemum Society.

Shirley, Millbroox, and Freemantle Horticultural Society.-The thirtieth amual general meeting of the above was held at the Shirley Hotel, Southampton, on the 17th inat., the President, A. Bagcow, Eiq, presiding. The Secretary read the report and statement of accounts, showing ateady
progren of the Society. The entries at the late how numbered 600 , an increase on the past, and the balance in favour of the Society was £35. There was a considerable increase in the attendance, and this enabled the committee to make oo good a financial report. The adoption of the report and account was followed by the re-election of the president, vice-president, and officers, and a ballot for a committee of twelve, for which there were twenty-four nominations. A vote of thank to the prefident, the press, and the retiring member: of the committee, \&c., clowed a very anccenful meeting and year.

Society of Jersey Gardener8.-At a meeting of this nociety held on Thuraday, Dec. 12, the programme was of an unaual character. Mr. A. Flatters, of the Manchester Microcopical Society, gave a microncopic lantern exhibition, being the first of it kind given under the arspices of the Society. Thene slides nambering 110, illastrated the internal structure of plantr, the botanical featares of each he pointed out. A number of photograph of horticultural interent, taken by the demonstrator himself apon the island, also formed part of the exhibition. Meetings are held monthly, and the Hon. Secretaries for the coming year are Memin. E. Reeve and A. Smith.

\section*{PLANTS AND FLOWERS AT TRENTHAM.}

A grand diaplay of winter-flowering plante in to be found in the houses at this place, the demand being very great. The houses at the present time are a chsrming aight, hundred of plant of the brilliant Poinaettia palcherrima, with enormona bractr, are aplendidly grown in amall potw. Quite as dazzling are the plante of Euphorbia jacquinieflore, whose flowering sprays are such as one seldom seep, especially in such amall flower-pote as these plants are grown in, namely, small and large 48 's. In these the plante maintain their healthy foliage right down to the rim of the pot. Plants of Salvie in variety, Primula, Cinerarie, Roman Hyacinthr, Talipı, Narcisule, Lily of the Valley, \&s., are grown by the thounnd, and great quantities of these are now in perfection. Beaides theae are Gesneras in variety.
The Orchid-houre are likewise gay with flowering plants, and in the Cattleja-house several hundred blooms of C. labiata are expanded; Dendrobinm Phalænopair, D. Wardianum, Lælia ancepr, are there in great quantities. In the Odontoglosamhouse dozons of aprays of \(O\). crispum and \(O\). Pescatorei had open flowerf, with numbers to follow. Of Mandevallias great numbers of fine healthy plants were noted, which could warcely be excelled for luxariant growth, many of them in flower, inclading a grand batch of the pretty M. tovarenain.

A houseful of Tree Carnations and Margueriter, the picture of robust health, was remarked with hundred of expanded flowers, connisting of all the leading varieties. The firat-named are invaluable for their fragrant flowert. A grand lot of lateflowering varieties of Chryonnthemuna are mout useful plante at this seamon, and the plants here are now carrying enormous quantities of blessoms good for catting, \&c. Rhododendron hybridam, Deatzia gracilis, Azalea molliv, and Lilien, are extennively forced, and these will follow thone already named. The healthineat of the foliage plants show that their cultural requirement are well understood; and plants were noted from amall things in thamb-pots upward to enormoun speciment, their use in the ducal manaion being namerous. The Bimboon are great favouriten here, and deservedly wo, for their light green, graceful foliage, and their adaptability for decorative purpones in the dwelling. In the

Irnit houses good crope of late Grape were atill hanging on the Viser, and splendid fruita of Tomatos. In the early Peach-housen the trees are just on the move, and the early Vines look very promiaing.
Great improvementa have been made by Mr. P. Blair in the pleature-ground. Many ornamental trees and ahrubs have been recently planted-indeed, the place hae undergone a great tranaformation, and is atill being improved, no that it will aoon match any exiating in the country.
The kitchen garden in well stocked with vegetable to meet the large demand made apon it teanarces. Many fine new building have been arected, inclading one in the village to merve at a lecture hall, with rooms for billiards, the library in connection with which is a very good one, the whole forming a great boon to the inhabitants of the place. The Dachess takes a great interest in the well-being of those mployed upon the eatate and the villagerp, as the Dake of Satherland does in horticulture. Tha garden show careful cultivation and attention to detail in every part, reflecting mach credit on the head gardener. Alfired Outram.

\section*{JOHN EVELYN.}

\section*{(Concluded from p. 577.)}

Evelin differed from mont of the savants of his day in the dislike to be ranked an an athor. The eatablishment of the Royal Society was a proof that the learned men of the late seventeenth century desired a common meeting-place, where their theorien and diacoveries could be expounded to men of kindred tastes. The aciantiat and the antiquary were not regarded with mach reapect at that period, and their apparent eccentricitiea were made the butt of mach chesp ridicule, and that ridicule, when enohrined in the "catchy" line of Samuel Batler, had the diaagreable tendecey to be accepted by the general public at truth. John Evelyn was too much of a man of the world and of a diplomatitt to indulge in the little personal vagarie which at that time, and for a long period afterwards, characterised the stadent of abstract thing. John Evelyn's appearance as an anthor wat not, as we have indicated, the outcome of a perfectly excaable vanity, but a laudable desire that others might profit by his experience. Ilis garden wat bis great hobby, and he found it so full of pleasure and inatraction that he wished other to participate. Botany, like chemiatry, was gradually pmerging from being a mere art of empiriciom, and Fivelyn did more than perhaps all his contemporaries together to compel the recognition and acknowledgment of these two ciences.

Evelyn's firat pablication was ianued in 1649 , when he was twenty-nine yeart of age. It was not until nine yeare after this that the firat of hia long and valuable series of horticultaral pablication made it appearance. It is a translation of Le Jardinier Fraņois, which appeared at Paris in 1651, and ran into six editione in nearly ae mady geara. It was signed by R. D. C. D. W. B. D. N., whatever these initials may or may not mean; the real name and dignity of the author being N. cie Bonnefone, valet de chambe du Roi. It was "transplanted into English by Philocepos," and publiahed by John Crooke at the aign of the Ship in St. Paul's Churchyard in Auguat, 1658. Evelyn was peranaded to make thin tranalation by his friend Thoma: Henahaw, to whom the work is dedicated. This book, which Erelyn regarded, and rightly 0 , an the beat treatise then extant on gardening, is an exceedingly intereating work to the literary antiquary. The catalogue of Pears ( 315 in number), Peaches (37). Applen, Plums, Chonies, and other fruit are exceedingly carions, The book is a duodecimo of 319 pages, with four platen by A. Hertock: it was an unquestionable anccems. A wecond edition appeared in 1669 (with Evelyn' name attached to it for the firat time), to which wat added "The English Vineyard Vindicated," by John Rone. The third edition appeared in 1672, and othern in 1675, 1676, and 1691.

Daring the interval which elapsed between the first and the second editions of the French Gardiner, Evelyn wrote and pablished his mont celebrated work, Sylva, "or a diacourse of Foreat Trees and the Propagation of Timber," to which is annexed Pomona, "an appendix conceraing fruit-treen in relation to cider, 166t." This was reprinted in 1669, and in 1679 , with considerable additions; again in 1705 with atill farther additions and im provements; and finally in 1725 , with other works on gardening-all these were in folio. Dr. Hanter, of York, edited and annotated an edition in quarto in \(\mathbf{1 7 7 6}\), with a number of beautifully-engraved plates by J. Miller; of this a second edition appeared in 1786, and a filth in 18:25. Dendrologic, an ebridgment by J. Mitchell, was issued in 1827. A very long article might b3 written on this most interesting
as I may jastify (without immodeaty) from the many lettert of acknowledgement received from gentlemen of the first quality, and other altogether atrangers to me." Evelgn was much disappointed at not recaiving the appointment of Inspector of the Royal Foreste, bat the " mighty man, then in despotic power "conferred it upon another "who had seldom been out of the amoke of London, where, though there was a great deal of timber, there were not many trees.'

Evelyn's next book, Kalendarium Hortense, or the "Gardeners' Almanack, direciing what he is to do monthly throughoat the year, and what fruita and flower are in their pime," was firs published in 169t, and in about forty years had run into ten editions. The British Museum copy, 1666, is intereating in having a presentation iascription to Lord Arlington in the author's handwriting. This was ant

JOHN EVELYN.
and valuable work. Sylva wat the outcome of an addrese delivered at the Royal Society in October, 1662," upon occaaion of certain quserien propounded to that illastrious Assembly by the Honourable the Principal Officers and Commiasioners of the Navy." The vitality of the work, seeing that it was the standard work on trees for over a centary and half, doen not need mach demonatration. Dr, Hanter tells us that coon after the pablication of Sylva, which made ite appearance under the auspices of the Rojal Society, "the apirit for planting increaned to a high degree; and there in reason to believe that many of our ahipe which, in the last war, gave lawn to the whole world, were constructed from Oakn planted at that time."

In a letter to Lady Sunderland, dated Daptford, Auguat 4, 1690, Evelyn telle un that Sylea wan a success "infinitoly beyond my expectations," and that it hae been "the occasion of propagating many millions of useful timber treen throughout this nation,
the firat kalendar of gardening operations published, bat it was one of the earlient which embodied the long practical experience of an able writer and close observer. There can be no doubt about the fact that this work had an extraordinary inflaence on English gardening, which indeed it may be asid to have revolationised. The origin of the book would appear to have been entirely private-a mere note-book of work to be done in each successive month, with no thought of publication. Writing in 1690, Evelyn informed Lady Sunderiand that it was written "almost forty yearen since," so that it more properly belonga to his earlier worky, although doubtless it containe the reault of his later experiencen. At all eventa, it was an epoch-making book, and a clasnic in ite way.

Nearly thirty yearn after the Ralendarium first appeared, John Evelyn asisted in contributing yet another volume to the art and practice of horticultare. Thin time the work, The Compleat Gard'ner, was a
tranalation from the French of J. de la Qaintinie, by George London and Henry Wise,* "to which is added his treatise on Orange trees, with the raising of Melons-omitted in the French edition, "and translated into Eagliah by Evelyn. This pablication, which was in folio, with a number of plates, had a long lease of popularity, to which Evelyn's "Addres to the Nobility and Gentry" contributed not a little. Evelyn's last work was Acetaria. "a dincourse on Salleta," which appeared in 1699 , and of which a second edition was called for in 1706. Mention may be conveniently made here of a very interesting "letter concerning the damage done to hie gardens in the preceding winter," which is published in the Philosophical Transactions, vol. iii., p. 28, 1634; and it ahould not be forgotten that it was in conequence of a recommendation of Evelyn's, in his Fumifugium, 1661, which dealt with the inconveniences of the air and umoke of London, that fragrant plants should be grown in nurseries, \&c., in the low ground near the metropolia, that the Lime trees were planted in St. Jamen's Park.
Evelyn himself tells un that he delighted in "a
a peculiarity known an heterosciam, or metorciem. Daring the aummer monthe, examples are frequently to be observed representing various geners, bat the majority of heterœaious Uredineæ belong to the genus Paccinia, and in this group it is a noteworthy fact that the uredospres and teleutoapores in all the species deacribed are only to be found on mono-cotyledons-generally granees, edges, or rushes.
A somewhat remarkable exception, however, has fallen under my notice. The species referred to it Puccinia Bintortæ, Str. = Paccinia Bistortæ, DC. which is classed in Plowright's Monograph of the British Uredinece and Ustilaginece under Hemipuccinia, a group that is supposed to be without meidiosporen. After a long series of experimentalcultures and observations during the past three yeara, the writer is convinced, beyond the alighteat doubt, that this species does not only possess æcidionporen, but is heterœcions in character. In December, 1893, a short series of observation were briefly detailed (Grevillea, vol. 22, p. 45 to 47), which it is unnceeseary here to repeat, beyond remarking that abeequent calture have fally confirmed previous obervations.

Fig. 133.-saybs court, jomn evelyn's residence, depteobd
cheerful gaiety; affect and cultivate variety; the universe itaelf were not beantiful to me without it ;" and those mont conversant with his writing will readily admit that cheerfulness and gaiety were amongat the most atriking characteriatics of his nature. His truly was a character "full of sweetness and apirit;" and the whole of the stirring period through which Evelyn lived produced no truer Eaglish gentleman.
His portrait, see p. 772, was painted on aeveral occasion. Firat by Cbanterell, in 1626; by Vanderborcht, in 1641 ; by Robert Walker, in 1648 ; by Sir Godirey Koeller, in 1685 ; and again by Kueller, for Pepy, in 1689. W. Roberts.

\section*{A REMARKAble PUCCINIA.}

Of the various parasitic fungi incladed in the group Uredinese, few are more singular in their mode of development than thone apecies which have the curious habit of apending part of their exiatence on one kind of host, and continuing it upon another at one time suppowed to belong to a different genur,

\footnotetext{
It may not be out of place to state here that the present Writor contributed to the Gardemers' Chroxicls of March 18 , Gardeaing 14. Worze a paper an "London and Wiea, and their
}

The fungus firat maken it appearance during the early part of April on Conopodium denadatam, and posiibly it may have hitherto been confused with Acidiam Banii, DC., from which, however, it is clearly distinct, and may be deacribed an followa: Esidionpores; Pseudoperidia in amall irregular cluaters, sested on orange thickening, mostly hypophyllous, on eegments and veine of the radical leaves, rarely on the cauline leaven, more elongated on the atems, and petiole nearly fiat or ahortly cylindrical; mouth narrowly contracted, walle rather thick, margina fragile, breaking up into white oval cellalen evenly covered with minute wart 20 to \(30 \mu\) in diameter. Spores globose, finely verrucose, white, endochrome, with a slight tinge of yellow, 15 to \(20 \mu\) in diameter. Oa the radical leaven and petoiles of Conopodium denudatum April and May.
In the spring of 1894, weveral plante of Conopodium denudatum, abundantly invaded vith the Ecidiam, were grown in pots ander glans for the parpose of testing whether the ecidionporen were sacceeded by any other apore form. Bat no farther reaults ensued, and the plants made an appearance in 1895 apparently healthy, and remained free from the fungne, showing that the myceliam in not perennial. In like manner, in!1894, planta of Polygonum Bistorta, bearing the teleutonporen wert isolated, and
in 1895 the plante came up healthy, and remained clear of the fungui throughout the eesson, and evidently the mycelinm also in this cate is not perennial.

Germinating wcidionpores were applied to the leavea of Conopodium denudatum and Polygonum Bistorta on May 1, 1895, bat not the slightent result followed on the former, whereas on the Yolygonum aredonpores made an appearance on May 15. Daring the past apring the fungus wat observed to be extremely common in the neigbboarhood of Halifas, and a number of planta of Conopodiam denadatam growing among Bistort, and bearing acidiosporen, were "marked," and for a fortnight were repeatedly vinited, bat no other apore form appeared on the earth-nut, while uredoapore ahowed abundantly on the Biatort:

By means of the uredospores the fungus apreads rapidly, reproducing uredompore in about twelve days. The uredospores are invariably nucceeded by telentospores in about the ame time; for instance, in the May 1 experiment, the teleutospores made an appearance on May 27. Although numerous observations were made on the teleutospores during the summer and autumn, in not a aingle instance was an attempt at germination noticed. Daring the year, germinating recidiospores and uredoupore were applied to other mpeciea of Polygonam, including \(\mathbf{P}\). avicalare, \(P\). cuapidatum, and \(P\). viviparam, bat without any reaulta, although the latter in given as the host in various worke. It is intended, however, to continue the experimente during the coming pear. The æcidioaporen were firat found by my friend, Mr. James Needham, at Hebden Bridge, in May, 1898. H. T. Soppitt, Halifax.

\section*{THE WEATHER OF 1895.}

The year which is just drawing to a close has been a remarkable one in many ways, and, from a gardener's point of view, may be looked upon in nome reapecta as one of extremes.
Jamaary commenced with a cold N.N.W. wind, which continued for some dayp, bat there was not much froat till the 10th, when the temperatare fell to \(14^{\circ}\). On the 20 th it rome to \(49^{\circ}\) in the shade, but on the 23 rd it fell to \(10^{\circ}\). There were only three nights in the month that the temperature did not fall below freezing-point, and thene were on the 17 ch , 20 th , and 21st. There were about \(3 \cdot 21\) inches of rain, including melted snow.

February was a dreadfully cold month, there being only two nighte daring the whole period that frout was not regiatered, and thene were on the 22 ad and 23 rd , when the mercury fell to \(33^{\circ}\) and \(34^{\circ}\) reapectively. The coldent night wee on the 5tb, when the thermometer fell to 0.5 . There was an unuavally amall amonnt of rain- 0.78 of an inch only-the greater portion of which waa melted snow. On three occasions only during fifty years bat there been lean,

March. - It was not till the 9 ch of this month that a general thaw aet in, but the aun was so bright in the daytime, that by the 13 纤 the ground was in good working condition, to that many of the garden crope were planted by the end of the month. Leax than 24 inchet of rain fell, the greateat amount being on the 27 th.

Aprih-The sarly part of this month wan dry, and very auitable for outdoor work, though the nighte were cold, but on no occasion did we register more than \(6^{\circ}\) of frout. Rsin was pretty plentiful, during the latter part of the month; so aleo were alage, for I never remember meeing such an abundance. The total rainfall was \(2 \cdot 14\) inches.
May wal a very dry montb, rain falling on aix occasions, and this only to the extent of 14 of an inch, this being a trifie leas than in the dry nummer of 1893. There were aeveral hot days on which the thermometer in the shade rose to over \(80^{\circ}\). Apple tree were in bloom very early, the firt with us expanding on the 6 ch . The coldeat night daring the month was on the 10 sh , when the temperatare fell to \(31.5^{\circ}\).
Jume wan also month of unusual drought, and though the nightm were cold, the dayn were warm, as there was no occation when the maximum did
not exceed \(70^{\circ}\) in the shade；the hottent dayl being the 9 ih and 24 th，when \(87^{\circ}\) was recorded on each dates．Oaly 36 of an inch of rain fell daring the month，this being the amallest amount for Jane registered since 1870 ．
Juty，ap till the 18：h，wa dry and warm in the daytim \({ }^{\circ}\) ，though the nighte wers cold．Oa the 16 sh the thermometer foll to freezing－point，while on the following day it rose to \(と 9^{\circ}\) in the ahade，bsing oas of the hutteat daysia the whole year．Between the 18 h and the end of the monith raia fell to the exient of 350 iaches．The hottent night war on the 25 st，the miaimum being 61.
Auguat wit ralay sill the 15 sh，with warm weather both night and day，after which it becmene dry and hot，the bottent day being the 22ad，when the ther－ moneter registered \(8 t^{\circ}\) ia the bade．The amount of rais which fell wat 242 iaches．
Sepfember was an anasaallp diy montt，there being only two daje on which there was any regintered， ad these were on the 7 th and 11th，the aggregate fall boing 73 of an iach，which I thiak is the lesst amount for the month since 1865 ，in which year there wa oaly 02 ．Oas of the brtest aighte was on the tith，the minimace baing \(50^{\circ}\) ．（）． 1 toa oces－ nione the uscimum reached wat ovep \(80^{\circ}\) ia the ande．the highest being on the 7 ch． \(86^{\circ}\) ，and on the \(25^{5} \mathrm{sh}, 83^{\circ}\) ；on thin la：ter dato \(117^{\circ}\) was reached in the ann。

O．tober wh，in some retpecte，a peculiar montb， for，wish the exception of the firat，which wan rery hot and dry，rain foll more or less on every day till the ybr，alter which it was beagtifal weabher till towarde the end．The warmest night was oa the 6 i ，when the miniman war \(58^{\circ}\) ；and the coldoes way on the \(23^{\circ}\) ib，whea \(18^{\circ}\) wat regiatered．Ruit fell to the extent of 277 incties．
Soombier was a very wet month，rain falling on tweaty－one daye to the extent of brge incher，which amoses hat only besn exceed of on thras occanion withia the last aixty yourt．Tais is all the more remarkable，for on bo cccasion wat there more than ＇ 81 regiateres，and this．wat on the 6ib．Not once daring the year have we had a sood in the river， which rant at the bottom of the gardea．The warmest day was on the 17 th．when the maximam reseted wat \(62^{\circ}\) ．On only four ocecviona did the tomperature fall below fresziog－polat，she collest night beiar the \(18: \mathrm{b}\) ，when \(25^{\circ}\) was rescbed．
Dsombor，so far，has been mild，and with she exesptioa of the 11 th ，when the temperstare foll to \(18^{\circ}\) ，the weather han been fairly milld．Oa the 15 ： the maxiwum was \(54^{\circ}\) ． \(\mathbb{E}, \mathrm{O}\), Primen，Mil．Sumer．

WEEVIL－A－even partina rowedy for the raveges coneed by thio pout amona Fores in atab－ lisbed collectime hat diviset wilap，I have no dombe cone of yar reflers．We ill bercsted in the followime respits of mater of nuccesafal experi－ acote in rrulient the grab without dictarving the jlestaffetel．Tae metril，so is ouly toe well I mow，dumase plavts ie tw，diferent waye，durink it larval and daring ite perfect ocstr．In the later the weevil，at we know，creeps about malr at migbt tiane，and gmaw bole through the frond：or maket agly gape il their dgut fo wack sa extent，that were they proveil they completely
deatroy the beauty of the plants, and eapecially of Harta-tongues where auch damage is more conapicuous. The remedy at this stage is simply persiatent hanting at night, taking the precantion to apread sheets of paper under the plante, so that when they drop, as they are apt to do at the least alarm, they may be seen and deatroyed. It is however, in the larval or maggot stage that they do the moat barw, as their attacks are then confined to the roots and crowns ; and as they are busy during the dormant seanon as well as in the apring and antume, the first indication of their presence, often in aeed pans an well as with adult plants, in a uudden drooping and falling over of the fionds, which are then foand to be quite loose, the whole of the roots and axis of growth being gone, and the plants, of course, destroyed entirely. We have repeatedly found batches of choice seedlinga oo invaded, that in a week or two the whole of the fronds may be blown away, not a fibre being left to attach them to the soil. Now the difficulty ia, that to remove these pesta has hitherto involved turning out the plants and thoroughly washing the roote in order to find the marandert, which are often anugly ensconted in the heart of the plant-and this, especially in the winter meason, is a risky operation, as well an a troablesome one. About a year ago, finding a batch of these larva, we kept them under water for several days to see how long immernion was required to drown them; but at the end of nearly a week they were atill alive, and we consequently abandoned that idea of drowning them out. Sabsequently, however, we plunged an affected pan under water, intending to leave it, if need be, a week or two rather than disturb a specially preciona batch of planta, and next morning, after only a night's immeraion, we were delighted to fiad all the maggote on the surface of the soil, perfectly active, it is crue, but equally perfectly at our mercy, which was a minas quantity. Repeated trials since then have convinced us that planging a plant so that water just covers the soil for twenty-four hours anffices to bring them all up in search for air, and thus to clear the pote or pane entirely with a minimum of trouble. Chas, T. Druery.

\section*{Variorum.}

\section*{A TOBACCO PEST}

For a number of years a disease allied to that which attacks the Potato in this country, has caust d grest dentraction in the seed-beds and plantations of Tobacco in the Datch East Indies, and particalarly in Sumatra. The colonial government commisaioned Mr. I. Van Bagda dE Hask to inventigate the disease, and to devise means of checking its ravagen. Mr. dr HaAN diecovered the cause of the disease to be a fungas nearly allied to Phytophthora Solsni. "Nevertheless," aya Von Egnest Hacluer in the Illuatrirt. Garten Zeitung for November, "according to my researches, this is not the case, this species of fungus not affecting tie Tobacco plant at all. The latter has shown, during these inveatigations of Mr. HaLLien, ex raordinary resiatance to many bacteris, and that which canse the wet-rot of Potatos has not the alighteat injurious influence on the Tobacco plant. In fact, leavea of the latter cut from the plant remain quite freah after being kept for four or five weeks in a damp cellar, neither withering nor decay ing, not even when the gonidia of Phytophthors and the bacteria of the wet-rot are sown over them, the sap of the glandular hair exerting a poisoncus influence on the Phytophthora and these bacteria I then," says Mr, E. Hallier, "carried out more accurate researches into the conserving properties of the leaven of Tobacco, and I am convinced that the living plant poseessen extraordinary conserving and disidfecting properties. The unen of Tobacco-nmoke and Tobseco-water have been known for a very long period of time for the destruction of plant lice, acsle and other iojarions insects, bat few persons are acquainted with the use of the sap of the living plant, of which every gardener ahould keep a atore for und at any seasun. It is not necesaary to give say recipe at is the case in the use of manufactured tobacco; and every intelligent gardener will know in which cases and in which manner frenh Tobaeco-
leaven or the sap of the plant should be used. For inatance in the cariiage of frait and flowert, s bouquet surrounded by a holder made of fresh leaves of the Tobacco-plant will remain fresh-looking at least ten times as long as when this prudent course is not adopted !

MARKETS
COVENT GARDEN, December 24.
[We eannot accopt any responaibility for the subjoined reports. They are furnished to us regularly every Thursday, by the kindness of several of the principal for the quotations. It must be remembered that these for the quotations. It must be remembered that these quotations do not represent the prices on any particuiar day, out only the general averages for the week preosding quality of the samples, the supply in the market, and the demand; and they may fluetuate, noc only from day to day, bat often several times in one day. ED.] Plants in Pots.-Average Wholegale Priges.

\section*{SEEDS}

Lovdon: December 21.-Mesers. John Shaw \& Sone, Seed Merchants, of Great Maze Pond, Borough, London, S.E., write, that the seed market now exhibits quite a holiday appearance, and transactions are few and far between, quotations all round are in consequence purely nominal, and no noteworthy feature whatever has developed itself. Meantime prices generally stand at a very moderate level, and with the opening of the New Yesr a good trade is hoped for. Niger seed on the spot appears nearly exhausted, and is much wanted. Other articles call for no comment.

\section*{FRUITS AND VEGETABLES.}

Farringdon: Dec. 24.- Quotations: - Cabbages, Col do. 2s. 6a. per tally, savoys, 4s. do.; Cauliflowers. 68. do. : Parsaips, 18. per score; Thrips, 2s. per dozen buaches Celery, 13s. per dozen rolls. Hosseradish 1s. 2d. per bushel; elery, 13. per dozen mim, Apples, Canadian Blenheims, 5s, per bush. ; Greeaings, 15s. per barrel; Baldwins, 188. ; Newtown Pippins, 18s., do.; Tucker's King, 22s. \(6 d\), do.; Ribstons, do. ; English
pound; Almiera do., 5s. per dozen pounds.

Average of prices at the metropolitan markets during the week ending December 23, and for the corresponding week last year:-Clover, best, 80 s. to 95 s. ; do., inferior, 50 s . to 70 s . ; hay, best, 80 s . to 90 s ; do., inferior, 38 s , to 60 s. ; mixture, 78s. to \(878.6 d\). ; and straw, 20 s. to 42 s . per losd.

Booss: J. P, E. F. C. There are no elementary books on forestry worth your atadying. Get the newest, viz, The Mamual of Forestry, in four volumer, by Psof. W. Schicb, published by Bradbury, Agnew \& Co., Limited, 8, 9, and 10, Boavprie Street, E C. - A. G. M. Baltet's The Art of Grafting and Budding is published by Mr. W. Rahinaon, 37. Soathampron Street.

Fochsias: Reader. The earliest-introduced speciea was macrostemma syn. coccinea, 1788 ; the next lycioides in 1796-both from Chili, and many other apecies in the first half of this century. The introducer of the first was maid to be a sailor, whose name is not known.
Holly: A. B. It will be quite afe to cut the old tree hard back into the old wood. When the roote are bared, at you propose doing, it would be advisable to take out a trench all round the tree at a distance of 5 or 6 feet from the stem, cutting back all roota that go beyond that distance, and filling the trench with fresh soil. The new loam and manare that you top-dress with will also do for filling the trench; or if that is too extravagant, you might mix a good proportion of these materials with the ataple. Lift Hollies in April, May, and Auguat.
Names of Fruits: \(J . W .1\), Hacon's Incomparable; 2, Beurré Diel; 3 Josephine de Malines; 4, Althorp Crasasne ; 5. Kaight's Monarch ; 6, Glout Morçaan; 7, Apple Court of Wick.-F. A. Whitehead. 2, Claygate Pearmain; 3, Cellini ; 4, Yorkshire Beauty ; 5. Blenheim Orange; 6. Damelow's Seedling.-A Southern Subscriber. Your Apples are not known to us. They are probably some loca varietien,-W. H. Divars. We do not recognise your Apples-No. 1 looks like Cellini, but is much sweeter than that sort, which of course you have. - Snowdon. 1, Golden Noble; 2. Old Golden Pippin: 3. Ribston Pippin ; 4, Claygate Pear main; 6, Wyken Pippin.

[^33]:    OONTINUED INCREANE TM the CIRCULATTON OF THE rwourate to Apy frotion af ompowning int ine Tho Publetier has the satis Elinomids" has, stioc the reftriuation of the "Cavideners Increaned to the extent of mon ine prise of the paper and that it continneen to theresi 80 pex cent. Adrertiows art reminded that on "corease weokily.
    
    
    

[^34]:    THE GOOD DIE YOUNG. - Unlike most HE GOOD DIE
    popular nayings, this has very little trath in it. Kxperience every day proves that some at least of the good are
    spared to malte the worid brighter and better, and a more spared to male the world brighter and better, and a more pleamant place to live in. In fact, our experience is that good poople, and good the thousanda of articles which have been widely advertisod and are now forgotten. Why? Because
    they were bed. On the other hand, we have HOLLOWAY's they were bad. of poor hamanity for fifty years and more. Why? Because they are good. Of a truth, thet which is good does not die, bet lives for all timo.

[^35]:    * The Sociét́ Nationale d'Horticulture do Frasce alloited ite higbent award for this shrub-a ist prize, wi.h a Firstclase Certifcate of Merit.

[^36]:
